Next-Generation Sequencing – NGS core facility, principles of NGS platforms, applications, and experimental considerations

基因體定序 - NGS核心設施簡介、應用、及實驗設計之考量

Mei-Yeh Lu 呂美暉

Associate Research Specialist,
High Throughput Genomics Core
Biodiversity Research Center, Academia Sinica

LSL, 2017/4/25

Outlines

Part I: DNA Sequencing & NGS Core

- Evolution of sequencing technologies
- NGS platforms and comparisons

Part II: Principles of common NGS applications

- DNA
- RNA

Part III: Prep works

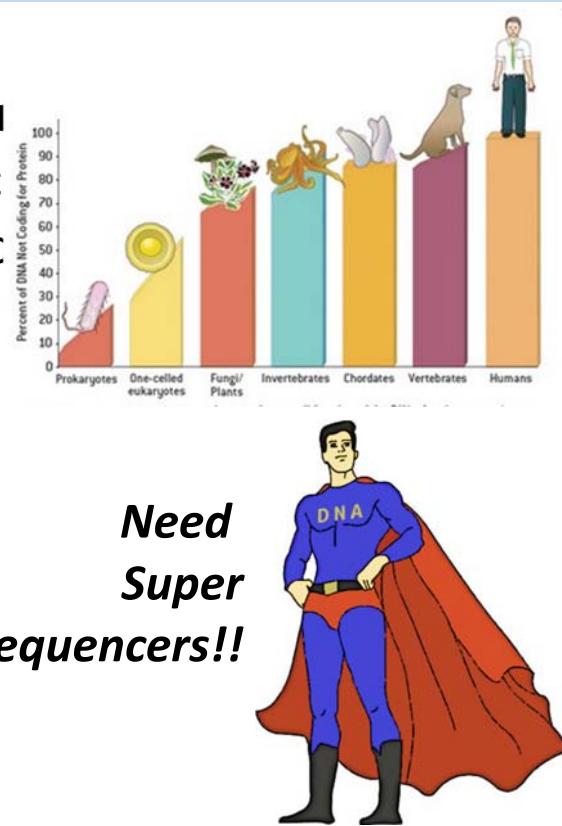

- Sample requirement and considerations
- Submission to NGS Core

Part IV: NGS Data & Resources

- Data types and QC
- Public resources

HT Genomics Core in Academia Sinica

- 2008: Established for biofuel project
- 2013: Promoted as NGS service
- Internal & collaborative projects
 - Pathogenic bacteria
 - Pathogenic/medicinal fungi
 - worms
 - Insects
 - Evo-devo: avian species
 - C3/C4 plants
 - Marine animals

http://www.ashg.org/education/everyone_1.shtml

NGS Service at BRC core

- Current NGS lineup:
 - 3 Illumina (HiSeq2500 *2, MiSeq)
 - Roche 454 GS+
 - PacBio Sequel
- SOPs: established for various NGS applications for both sequencing platforms
- Provides consultation on:
 - Project's need
 - suitable NGS experiment design
 - Sample preparation
 - Cost analysis

Launching of the 3rd-Gen sequencing service of PacBio Sequel system

The 3rd-Gen Sequencing

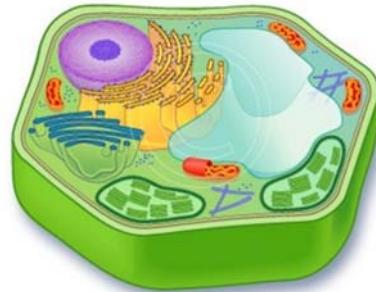

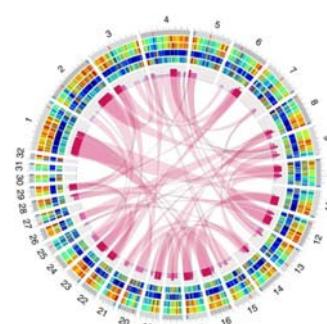

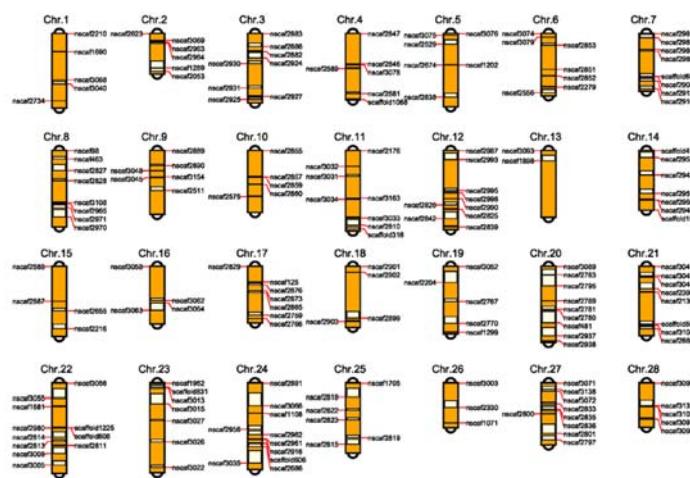

<http://ngs.biodiv.tw/NGSCore/>

I. DNA Sequencing

- Evolution of sequencing technologies
- NGS platforms and comparisons

Genome

- a full haploid set of chromosomes with all its genes; the total genetic constitution of a cell or organism.

- Nuclear chromosome**
- Plasmid (bacterial)**
- Viral**

- Plastids:**
- Mitochondrial
 - Chloroplast

In general, genome size increases with organism's complexity.

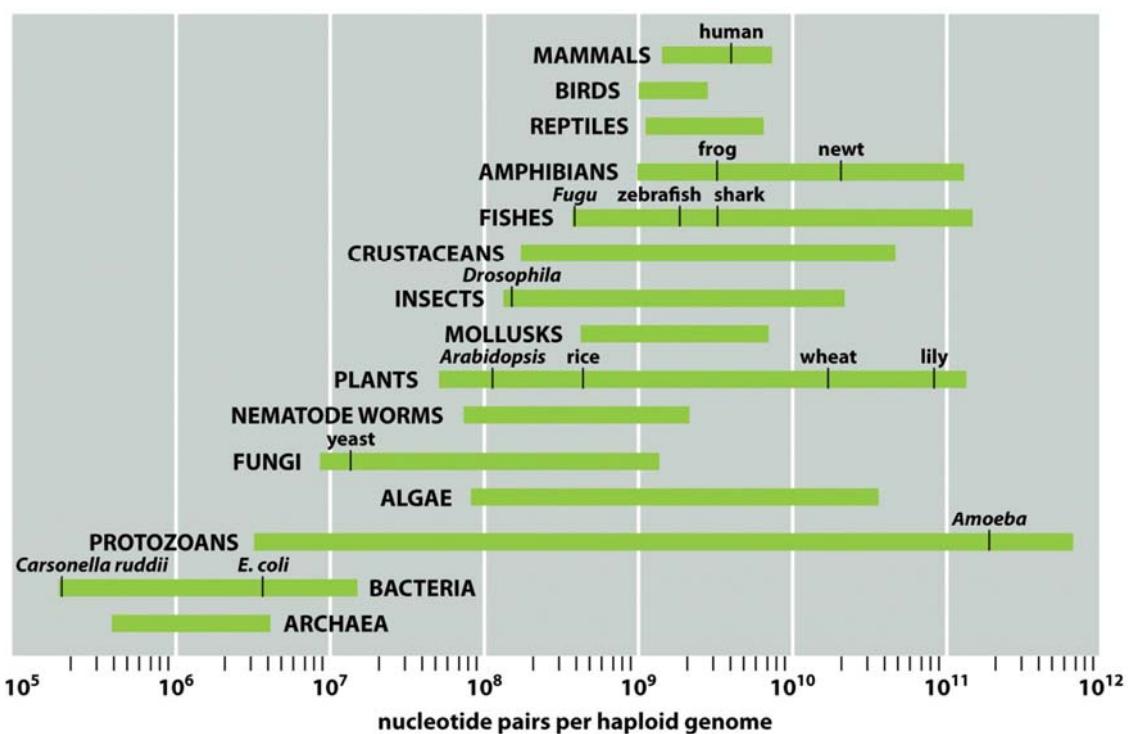

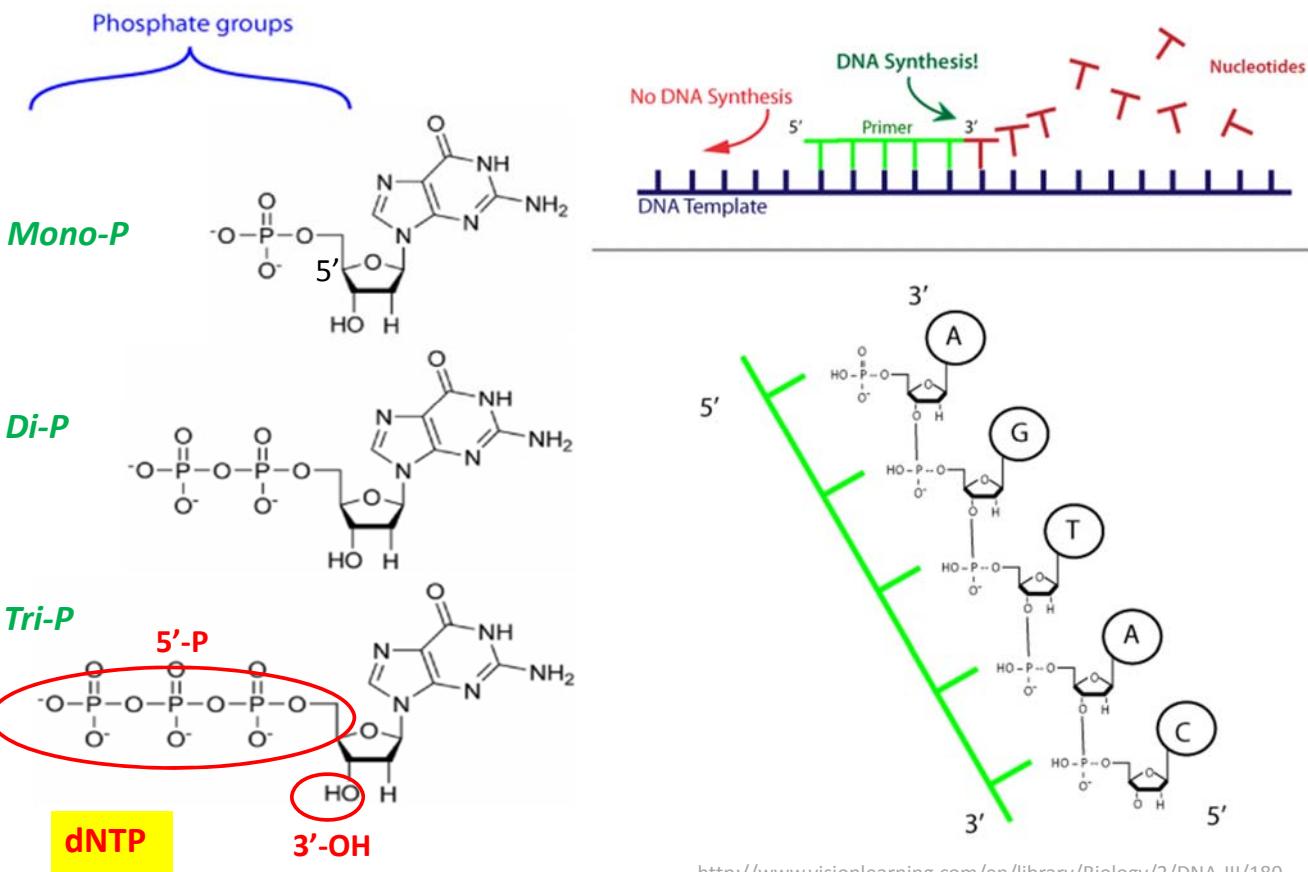

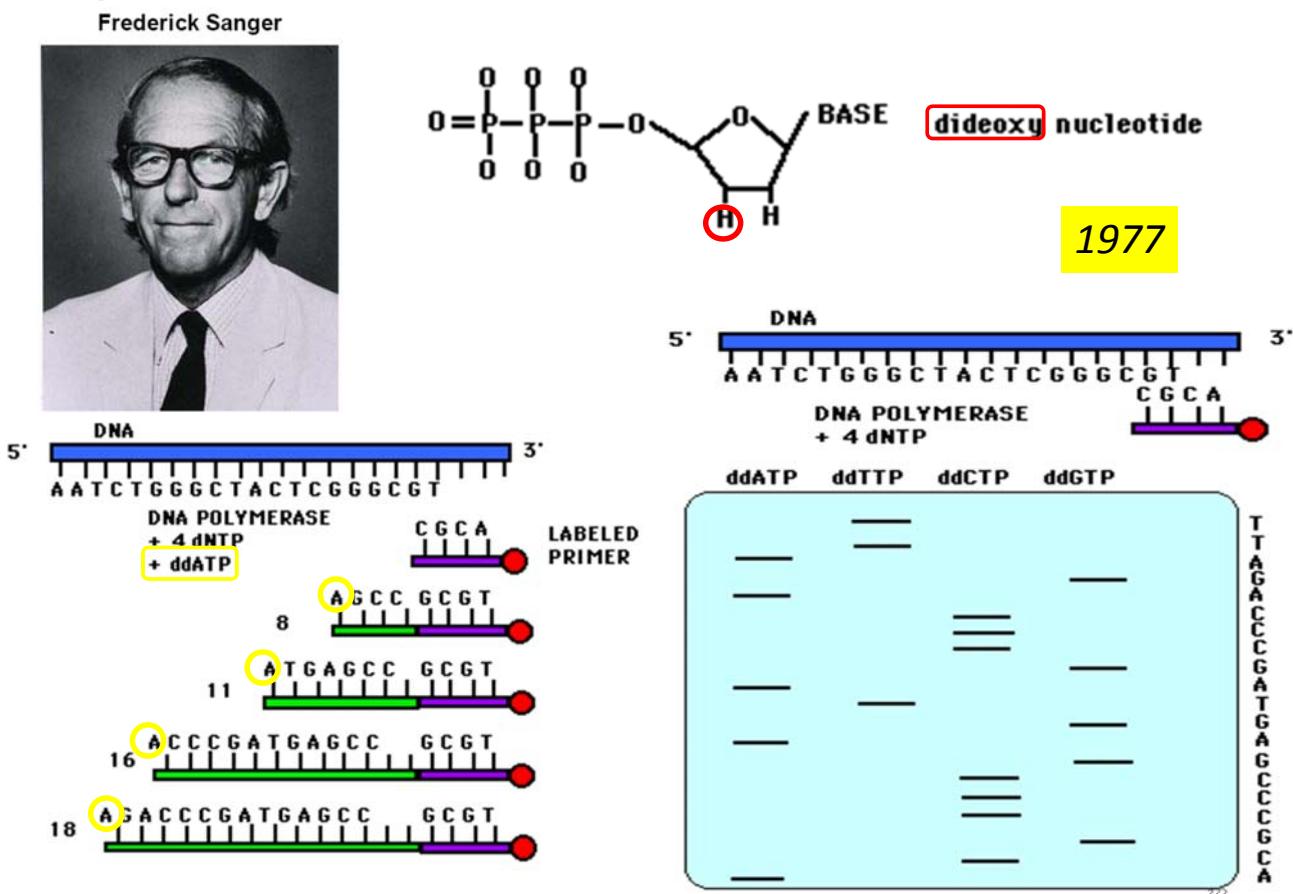

Figure 1-41 Essential Cell Biology 3/e (© Garland Science 2010)

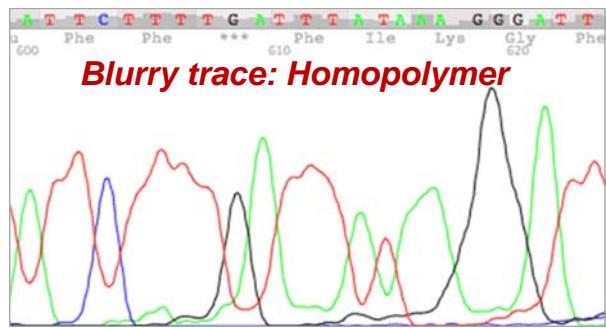

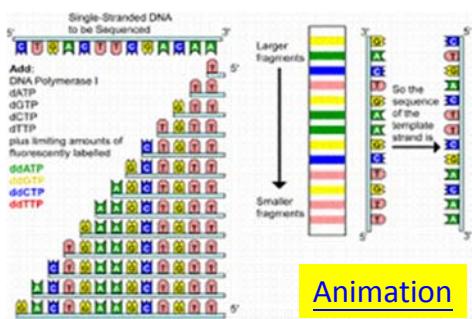

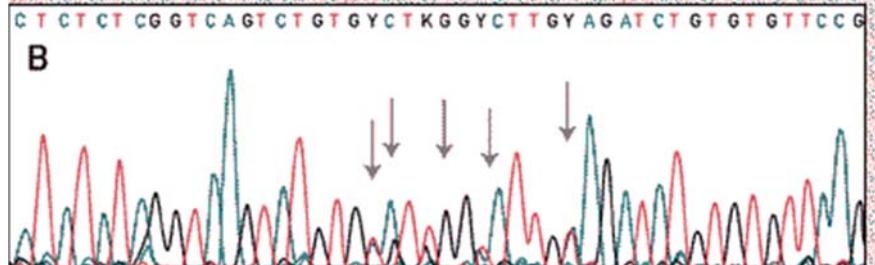

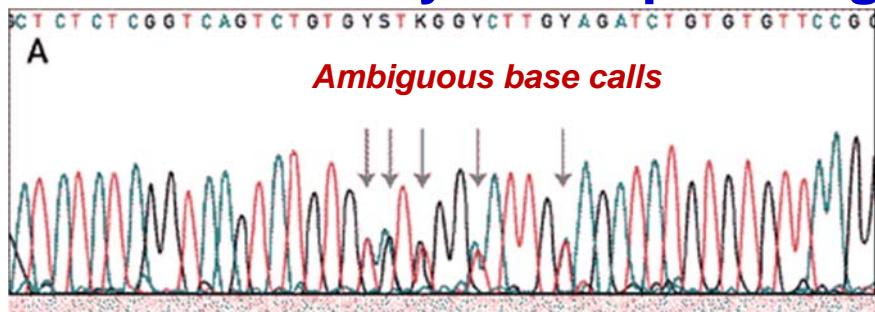

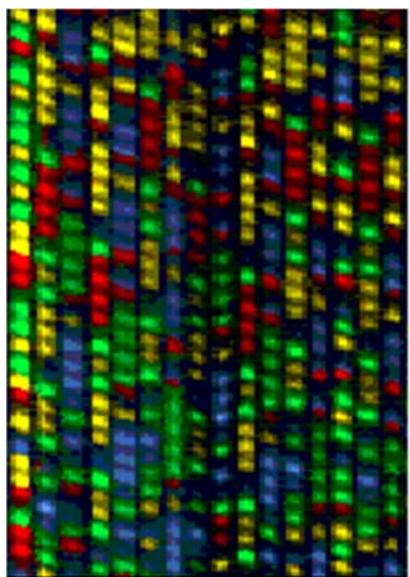

DNA synthesis - polymerization

Sanger Seq.: chain termination w/ dideoxy nucleotide

Fluorescent Dye: Terminator Cycle Sequencing

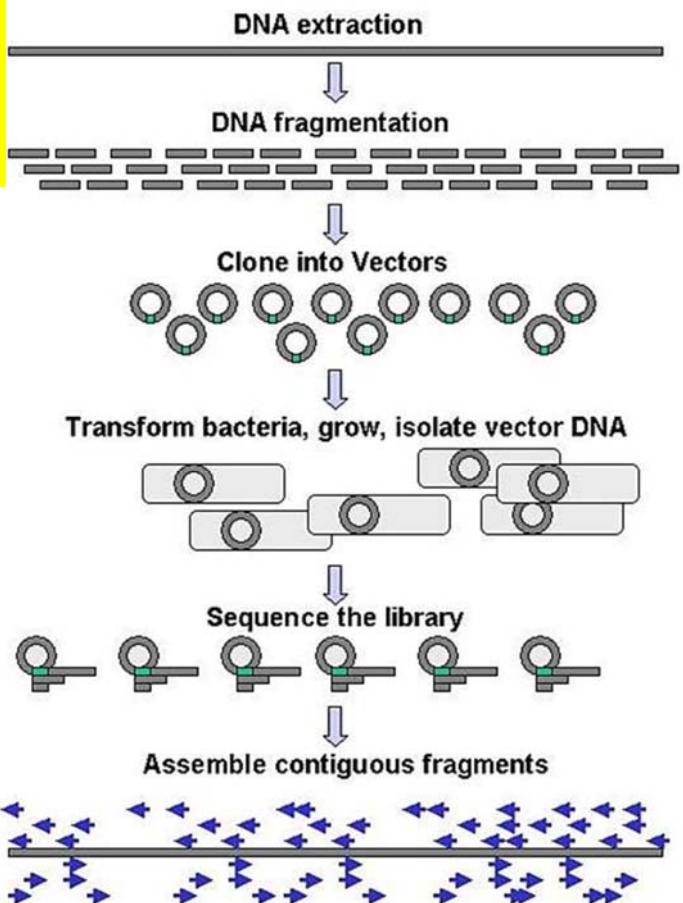

Genome Sequencing: Hierarchical cloning

BAC: 100-200kb

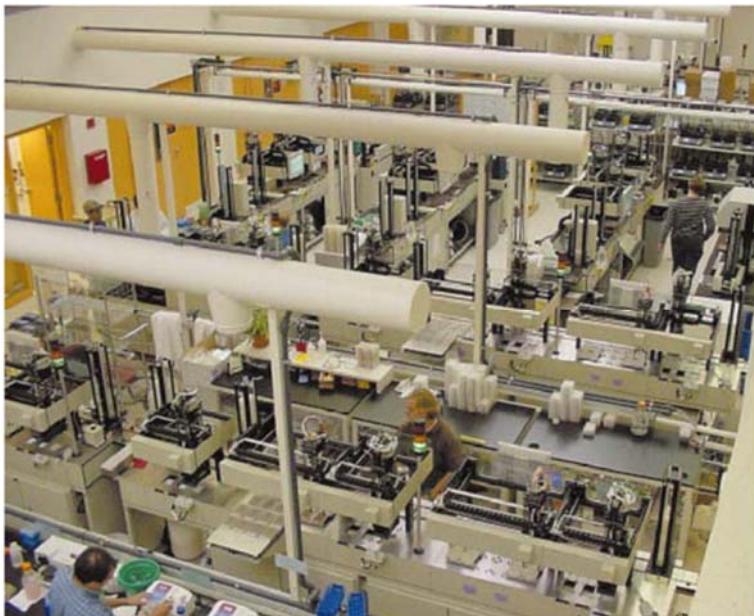

Fosmid: 30-40 kb

Plasmid: 1-10kb

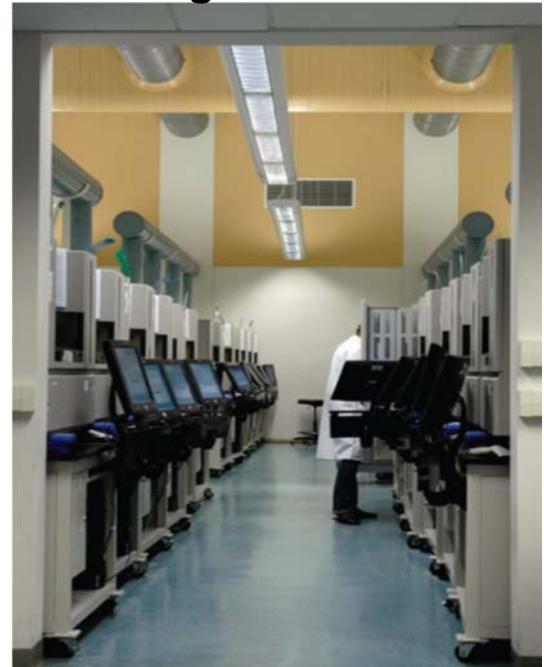

Large scale Cappillary Sequencing

Library factory -
Whitehead Institute

Sequencing factory -
Sanger Institute

13

Nature 409, 860-921(15 February 2001)

Next generation Sequencing

- Improvements in:
 - Enzymes
 - Chemistry
 - Image analysis
 - increased sequencing capabilities.
- Potentials to dramatically accelerate biological and biomedical research
 - *by enabling the comprehensive analysis of genomes, transcriptomes and interactomes,*
 - *by tending to become inexpensive, routine and widespread, rather than requiring very costly production-scale efforts.*

[From: Introduction to NGS.](#)

NGS – massive parallel sequencing

Current Popular platforms:

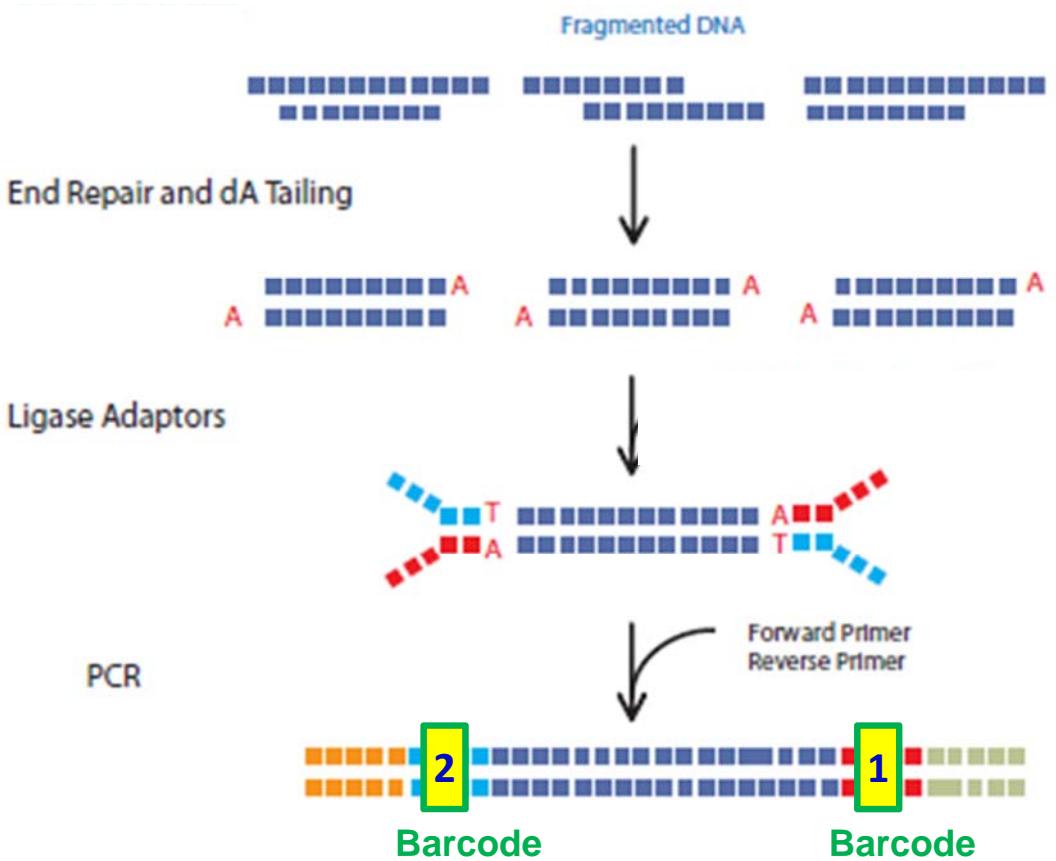

- **2nd-Gen: clonal amplification**
 - Roche 454: GS FLX, , 454 Jr., 454 XL+, 454 Jr.
 - Illumina: GA, MiSeq, HiSeq, NovaSeq
 - Life Technologies: SOLiD, Ion Torrent, Ion Proton
- **3rd-Gen: single molecule sequencing**
 - Pacific Biosciences: PacBio RS II, Sequel
 - Oxford Nanopore Technologies

15

Advances in Sequencing Technologies

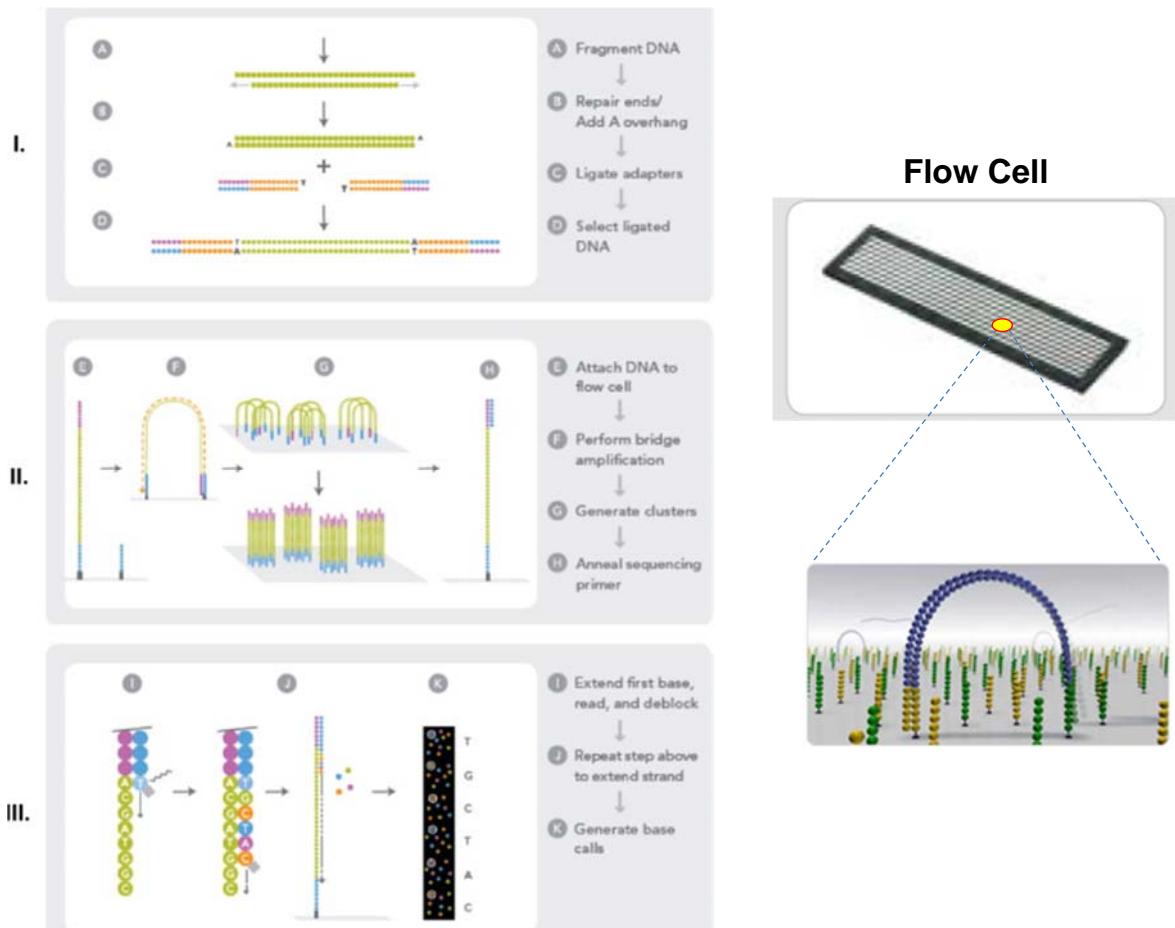

NGS Library Preparation Workflow

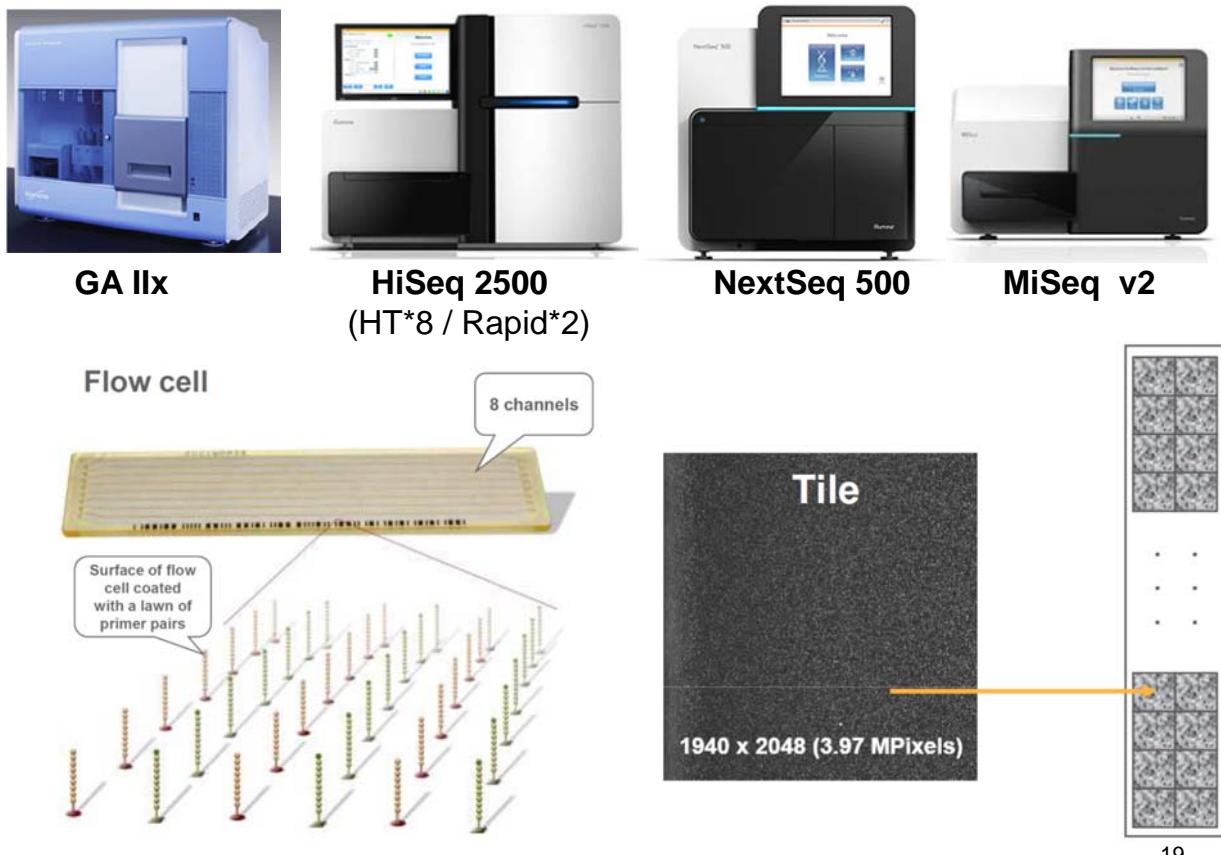

17

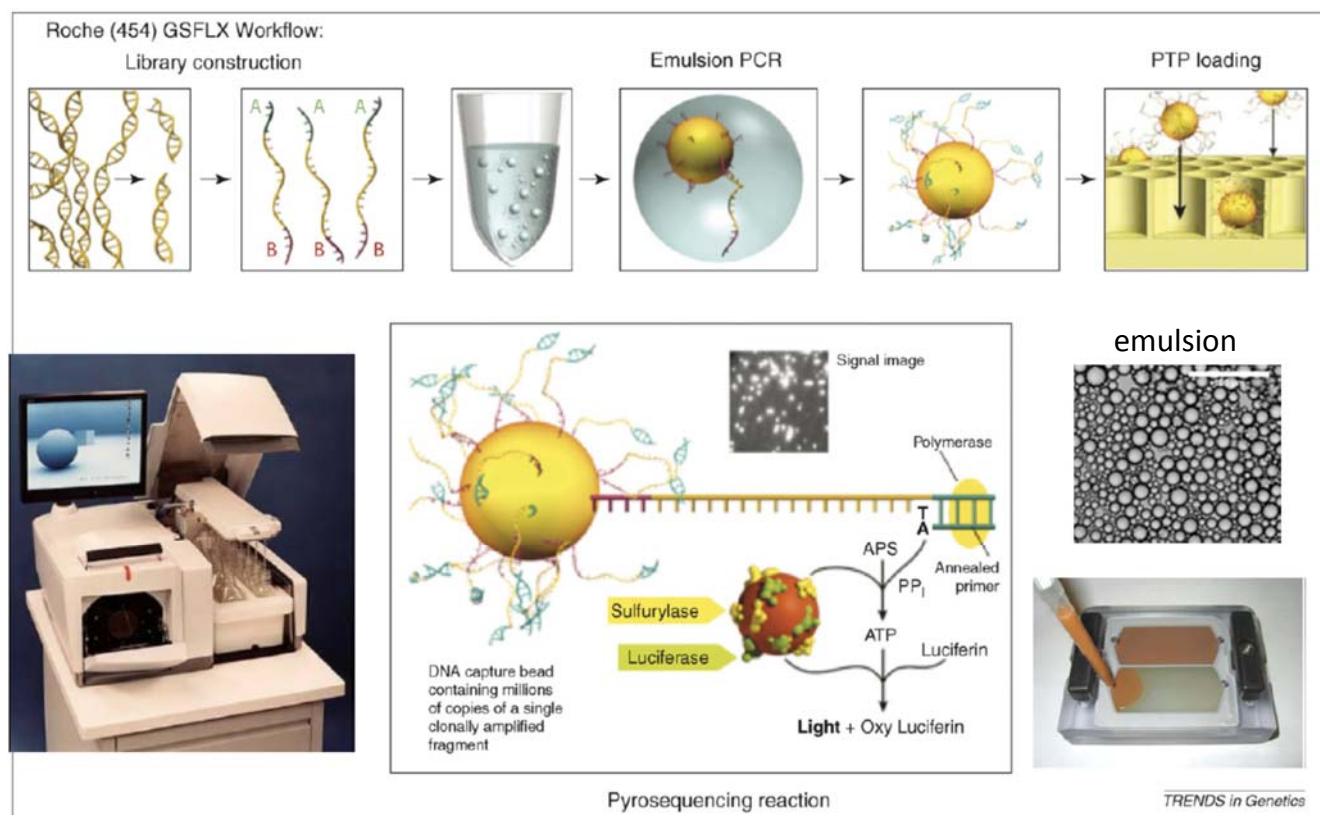

Illumina/Solexa: Cyclic Reversible Terminator

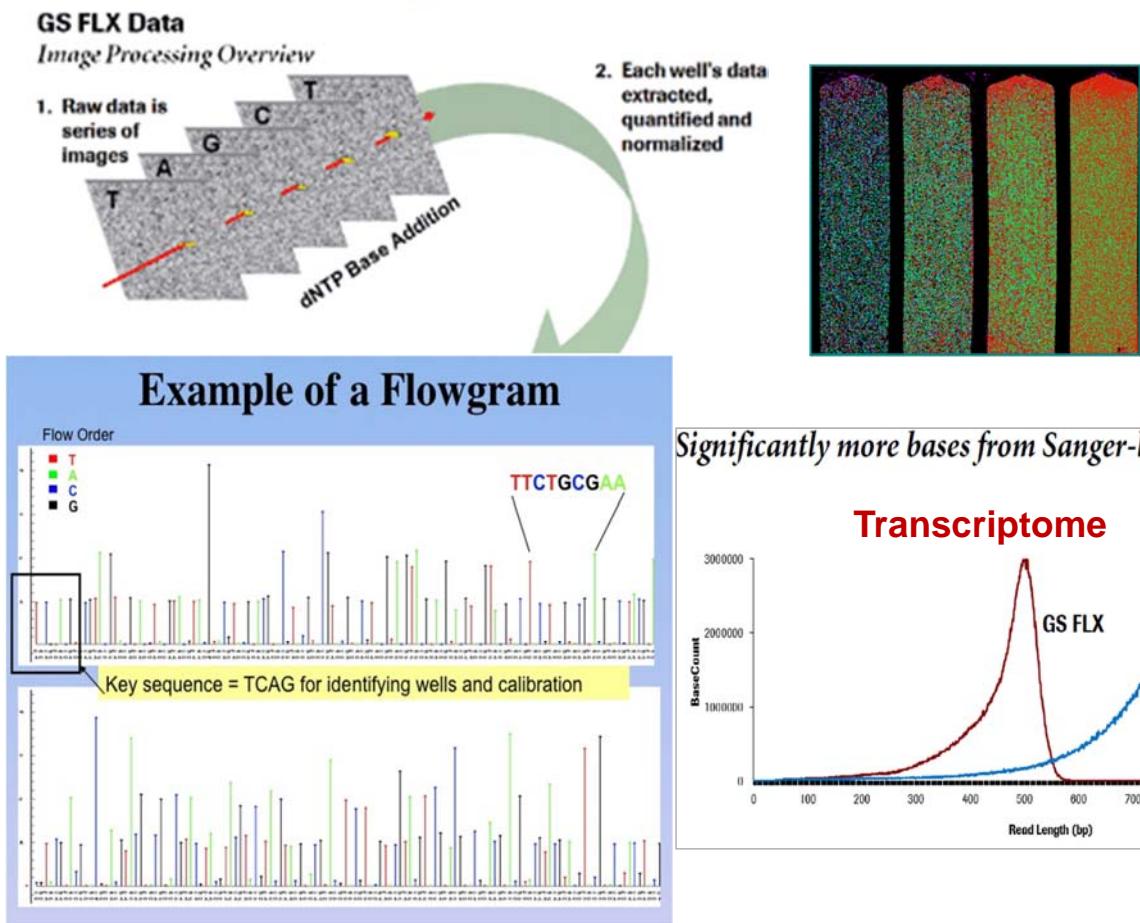

Illumina – Flow cell imaging

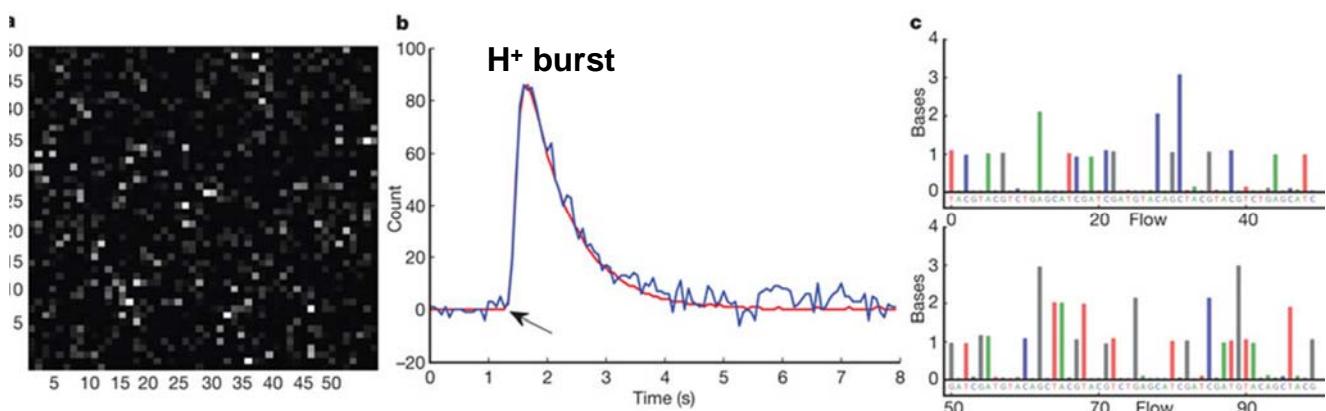

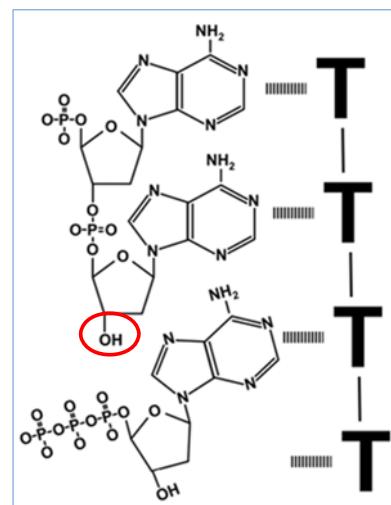

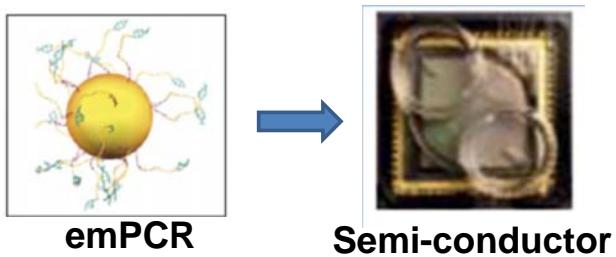

454: emPCR & pyrosequencing

454 flowgram and read length profile

Ion Torrent/Proton: Sensing bulk release of H⁺

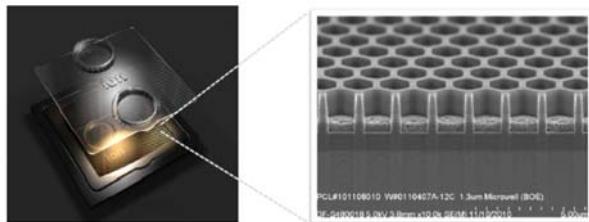

Life Technologies – proton sensing

PGM™ for genes.
Proton™ for genomes.
Sequencing for all.

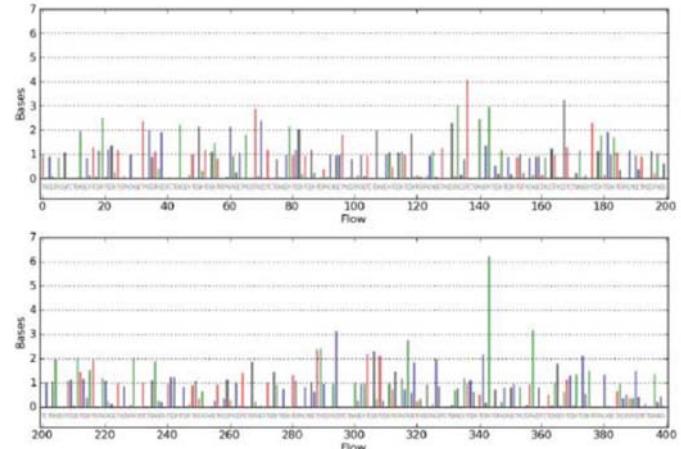

Ion PGM™ Sequencer

Ion Proton™ Sequencer

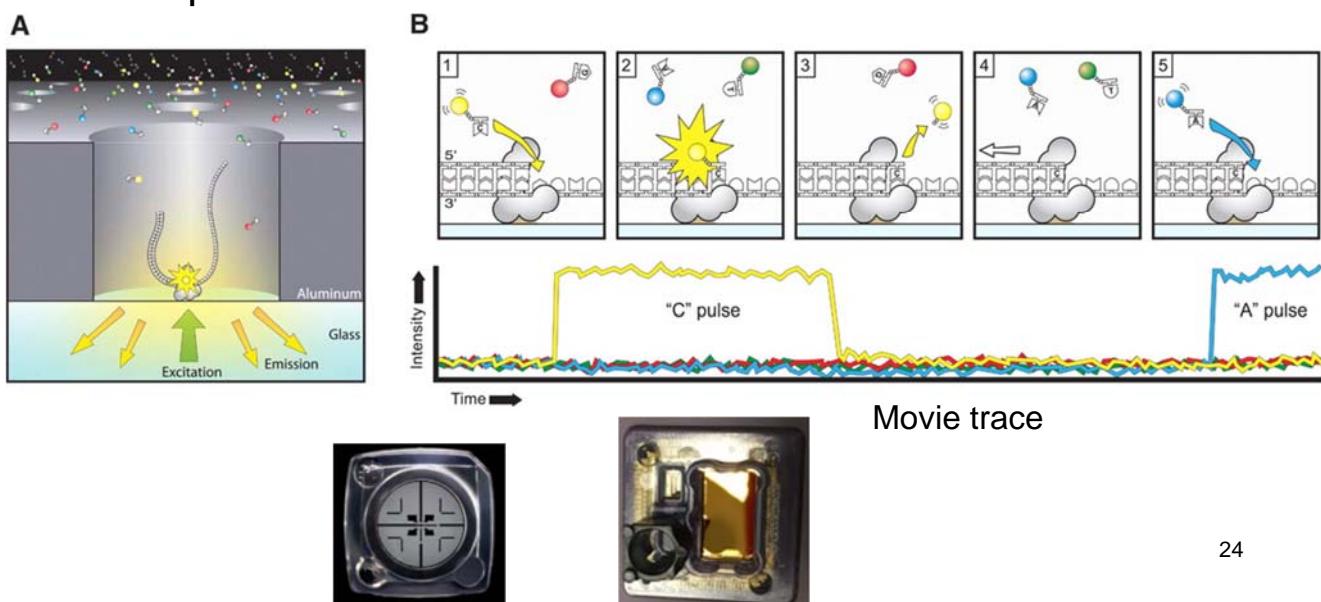

Chip: 台積電

23

PacBio: 3rd-Gen SMRT Sequencing

- Single Molecular Real Time (SMRT) real-time technology
- ZMW (zero-mode waveguides), a 100-nm hole with DNA/Polymerase complex immobilized at the bottom; recording fluorescence released from P-dNTP upon incorporation

24

Signal Processing and Base Calling

Converting pulses of light into DNA bases and kinetic measures

Read length: avg. 7-10 kb, up to 20kb
Throughput: 3-5Gb
Accuracy: 85% (1X) to 99.99% (30X)

Standard

Long read

Circular Consensus

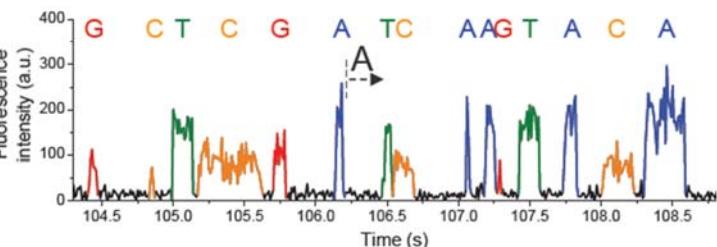

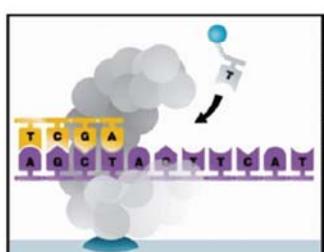

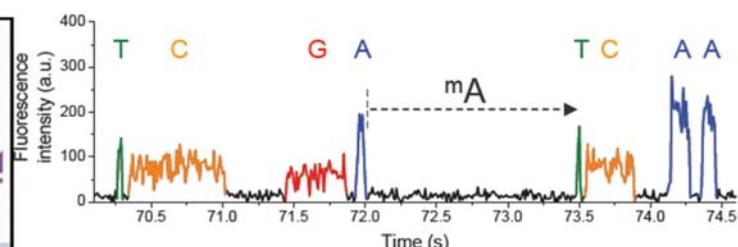

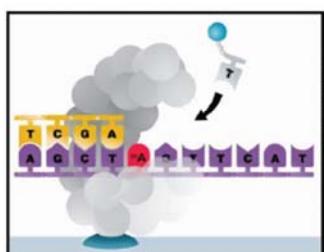

Short consensus read

Continued generation of reads per insert size

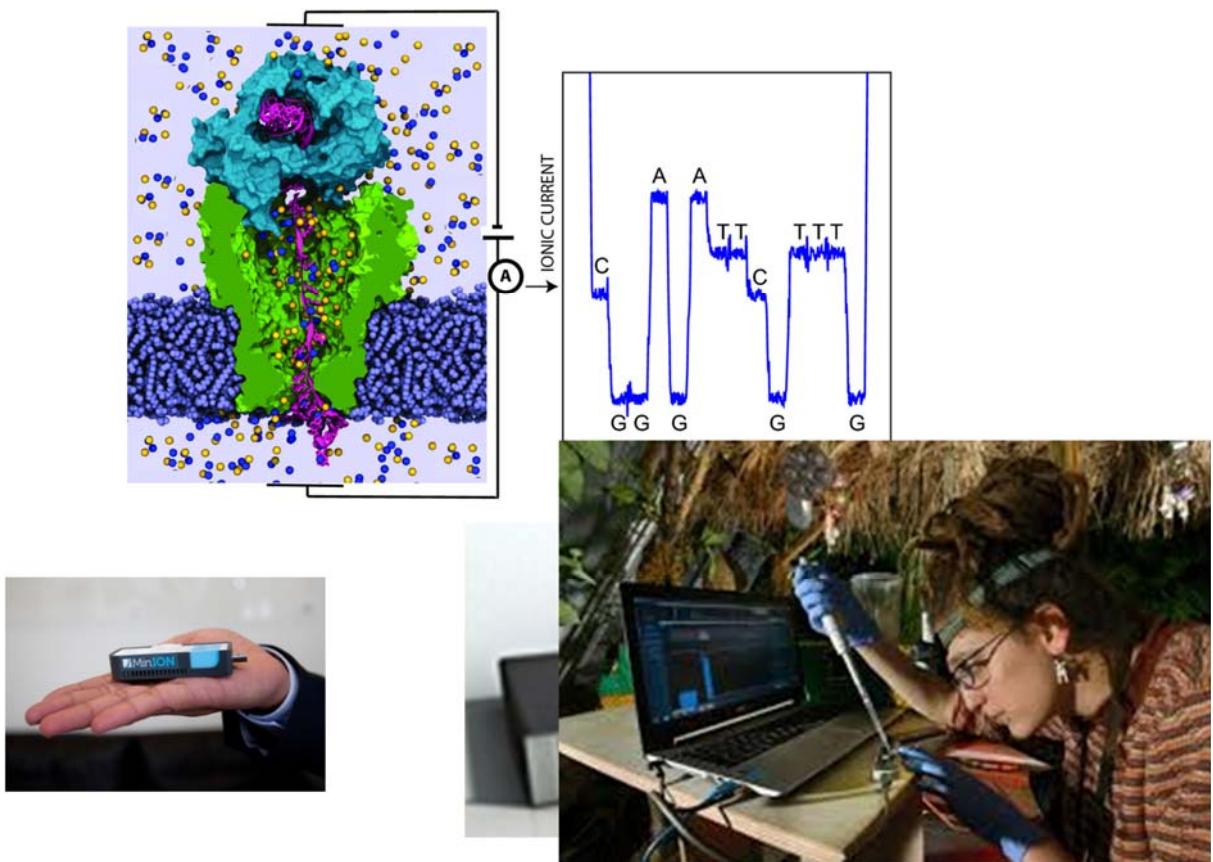

25

Key Feature: Kinetic Information

- Differentiation between modified and non-modified bases
 - Epigenetics, DNA damage, New, novel modifications
- Direct observation (e.g. no bisulfite)

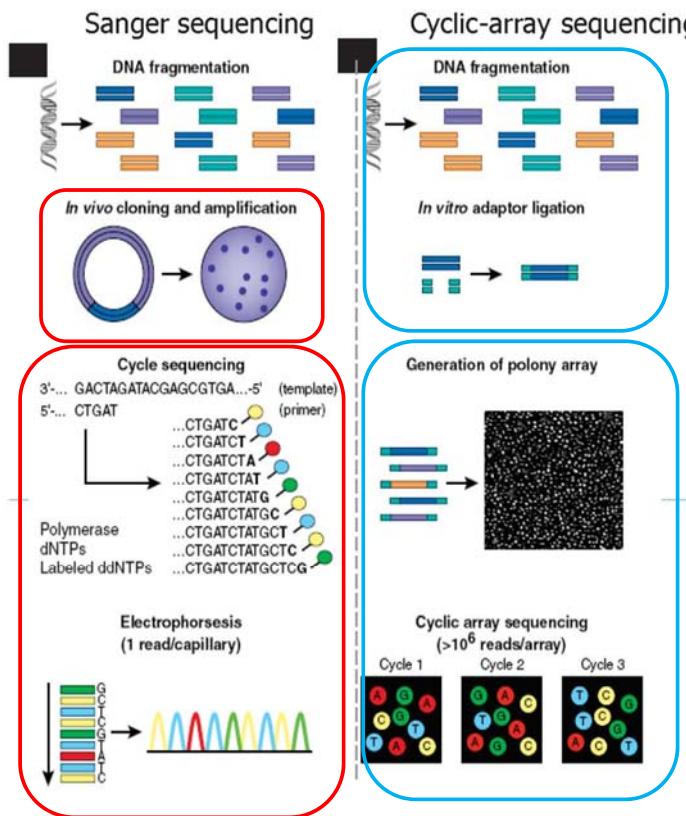

NanoPore Sequencing Technology

NGS Platforms & Features

	Roche 454 GS +	Illumina HiSeq 2500 (*2)	Illumina MiSeq	PacBio Sequel
Chemistry	Pyrosequencing	Cyclic reversible terminator		Real-time single molecule polymerization
Chip format				
Output/run	500-850 Mb	HT mode: 1 Tb Rapid mode: 150 Gb	up to 15 Gb	Current: 3-5 Gb Future: 7-10 Gb
Read length	400-1000 nt	PE 50-250 nt	PE 50-300 nt	1-15 kb
# Fragments /lane	1 M reads	150-180 M (Rapid) 200-250M (HT)	12-15 M (v2) 20-25M (v3)	350-500 K / SMRT cell
Data quality	> 99%; homopolymeric errors; tolerate high GC%	> 99.9%; Tolerate homopolymer; sensitive to high GC	> 99.9%; Tolerate homopolymer; sensitive to high GC	Raw ~ 85%; CCS ~ 99.9%; homopolymeric errors; tolerate high GC%
Application	De novo genome & transcriptome; Long amplicons	Highest throughput De novo assembly; Re-sequencing	De novo assembly; Re-sequencing; amplicon	Genome assembly; structural variation; phasing; Iso-Seq

Next-generation DNA sequencing

Advantages:

- adaptor-mediated library construction
- Clonal amplification to enhance signal intensity
- No bacterial cloning, colony picking, chr. Walking
- Array-based sequencing
- Massive parallel sequencing
- Much cheaper per *output unit*

<http://ueb.ir.vhebron.net/NGS>

II. Principles of common NGS applications

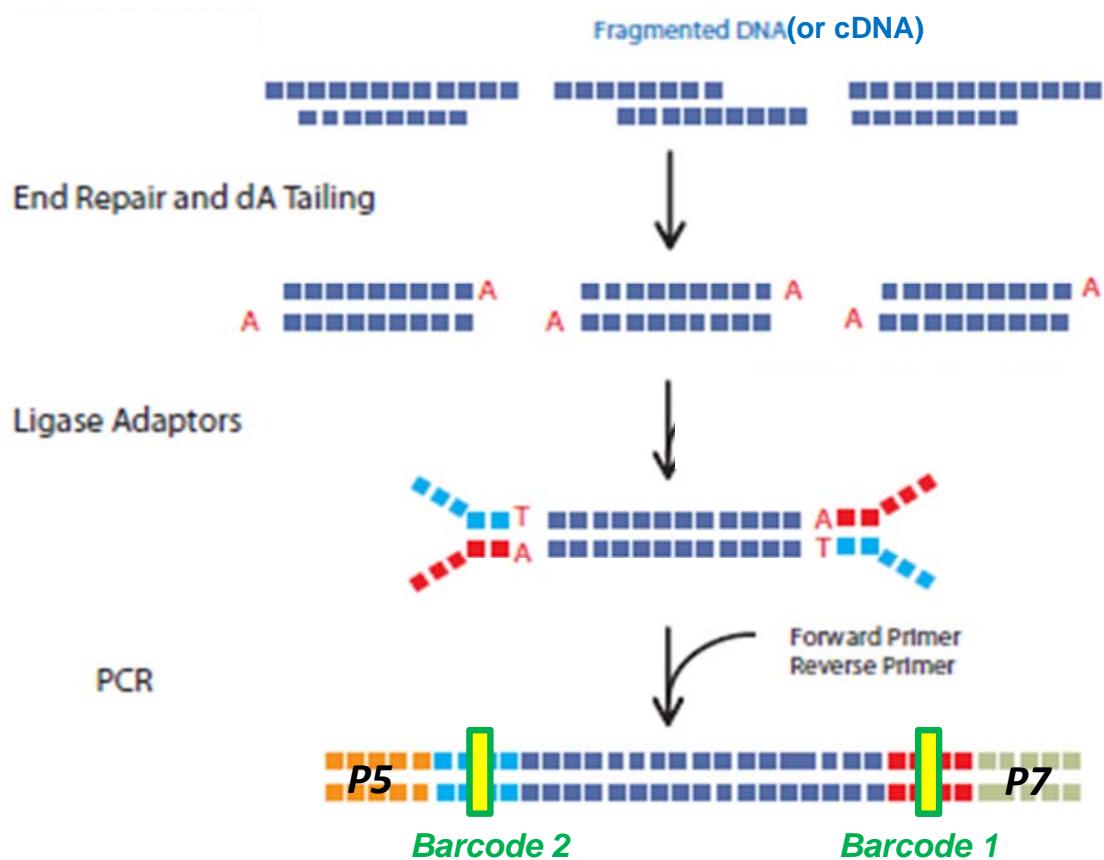

- DNA applications
- RNA applications

Genome Sequencing

- *De novo*
- *Re-sequencing*

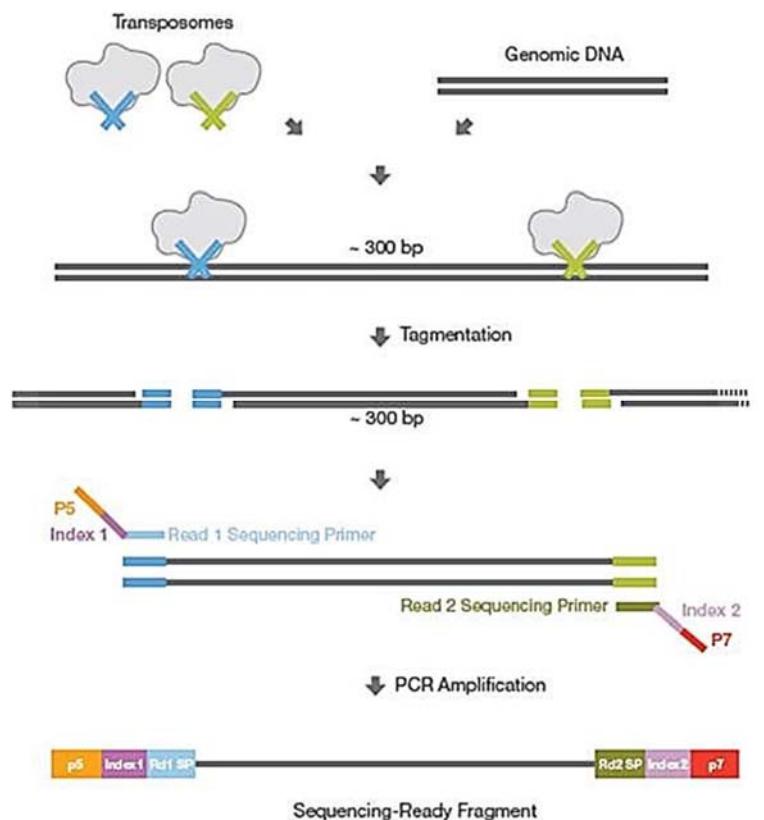

31

1. Shotgun gDNA Library Preparation

52

2. Tn tagging - Nextera Library prep

1. TemplateDNA + transposome complex (contain adaptor)

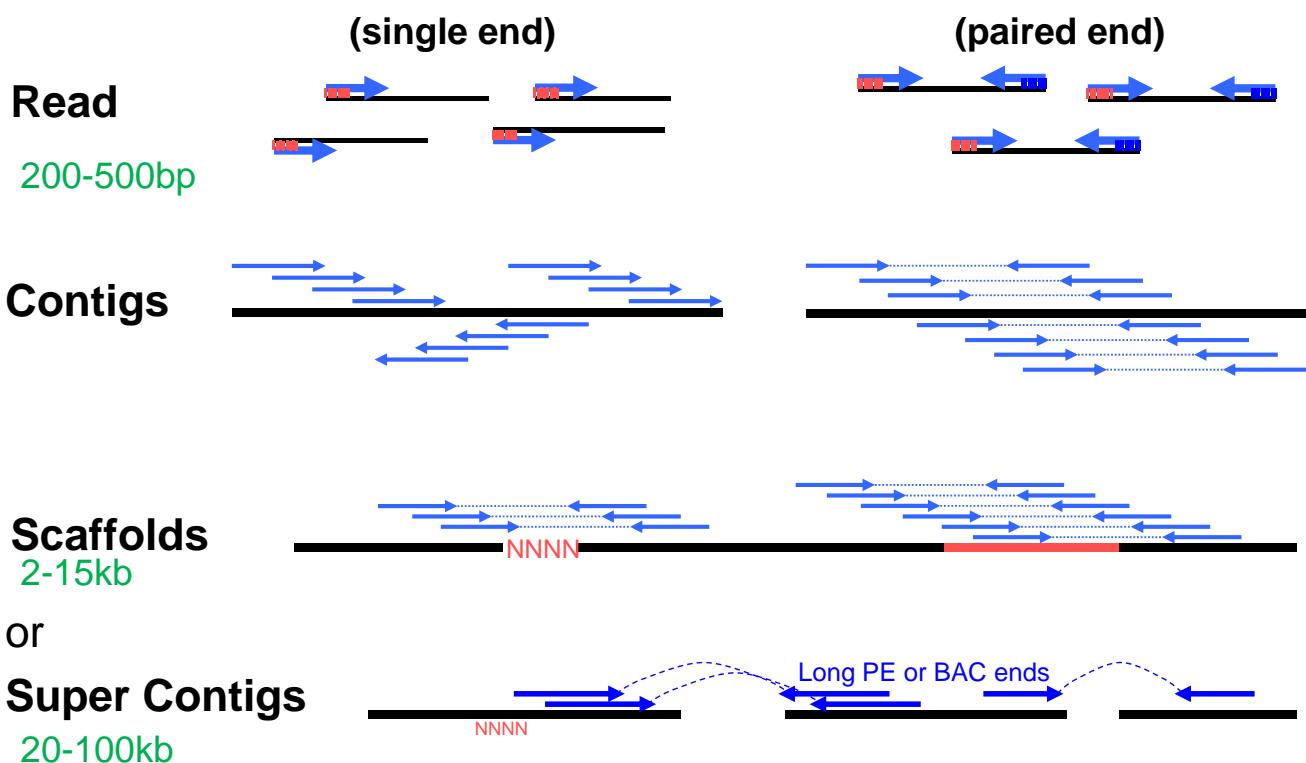

2. Tagmentation breaks DNA and add adaptor to ends

3. PCR amplification to engineer barcode and sequencing primers

33

http://www.gtbiotech.com.tw/products/Nextera_XT_DNA.asp

Hierarchical Genome Assembly

34

De novo Genome Sequencing

- Local assembly: with size selection
 - shotgun PE: *end-overlapping*
 - 200~600bp insert; PE2*150~300bp, 50-200X coverage
- Scaffolding:
 - Mate-pair: 2~15kb (size selected), 20-50X
 - 454 long PE: 20~30kb jump
- Bridging over small gaps: LIPE
 - Shotgun 1~1.6kb insert
- Gap filling: PacBio, NanoPore long Reads
 - 1~30 kb

35

Re-sequencing: Variant detection

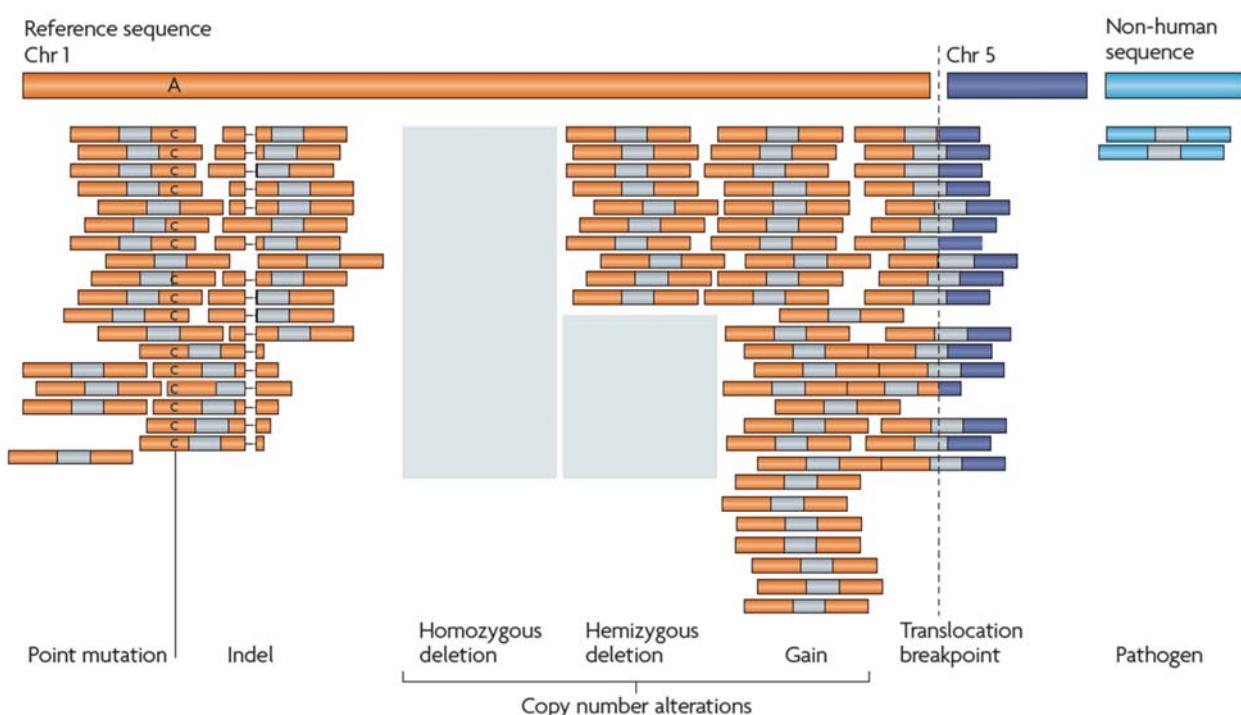

Figure 3 | Types of genome alterations that can be detected by second-generation sequencing. Sequenced

Whole Genome Re-Sequencing

- **Variant calling: SNPs & short INDELs**
 - shotgun PE: SR or PE
 - Read length: 100~150bp
 - >30X coverage per haploid genome
- **Genome re-arrangement: longer INDELs and break point**
 - Gel-size selection
 - PE2*150~300; 30-50X coverage
- **Copy number variation:**
 - PE2*100-150; >30X coverage

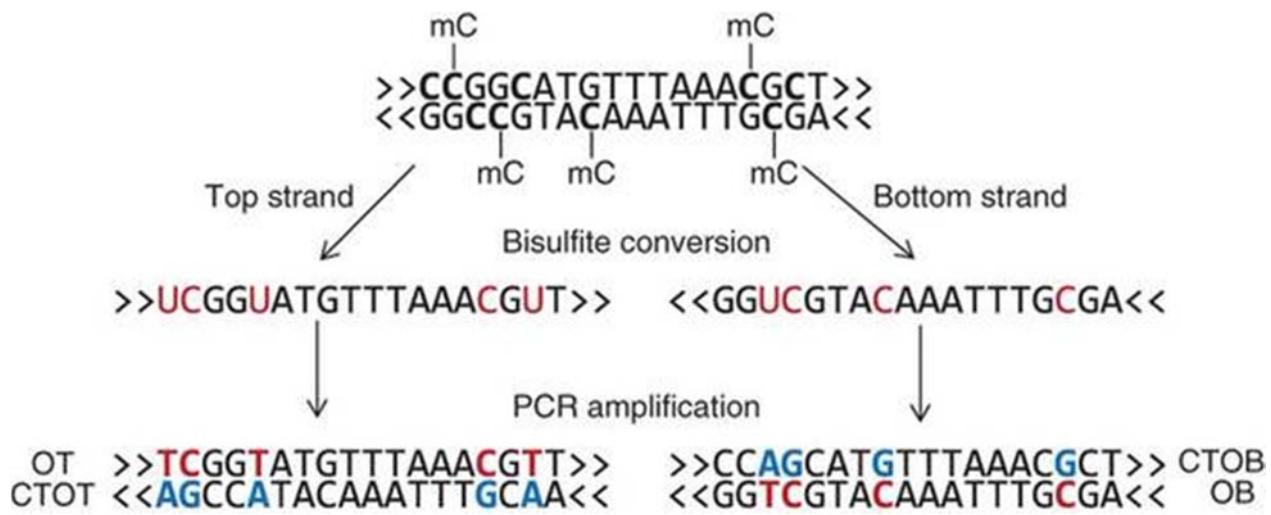

37

Epigenetic sequencing

- *Bisulfite-seq*
- *ChIP-seq*
- *Histone-IP*

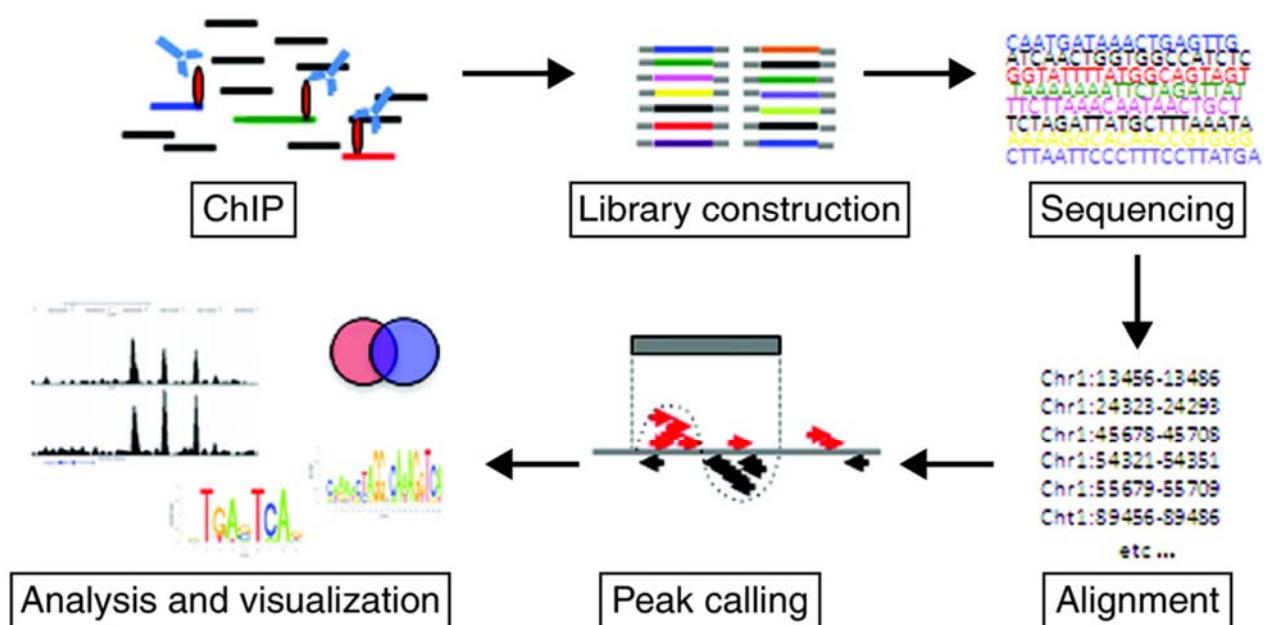

38

Effect of bisulfite treatment of DNA

<http://www.nature.com/nmeth/journal/v9/n2/full/nmeth.1828.html>

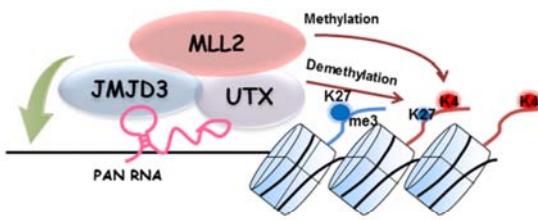

ChIP-seq procedure

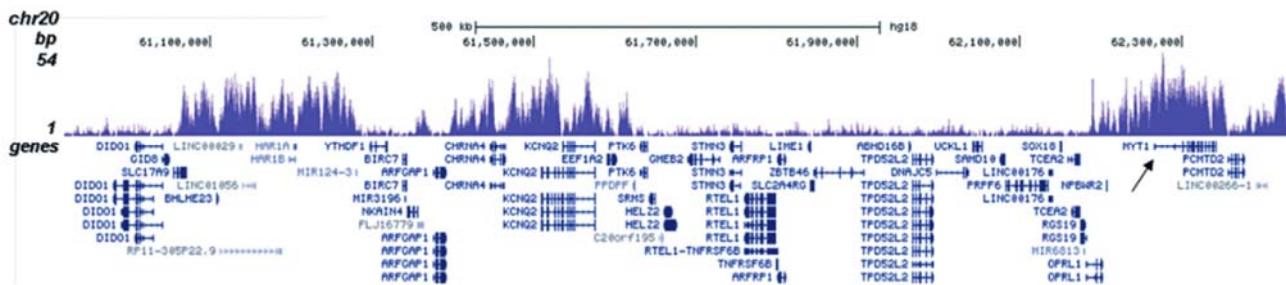

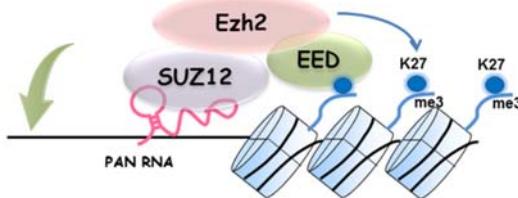

Anti-K27me3

B. Guide/Scaffold

(a) Gene activation

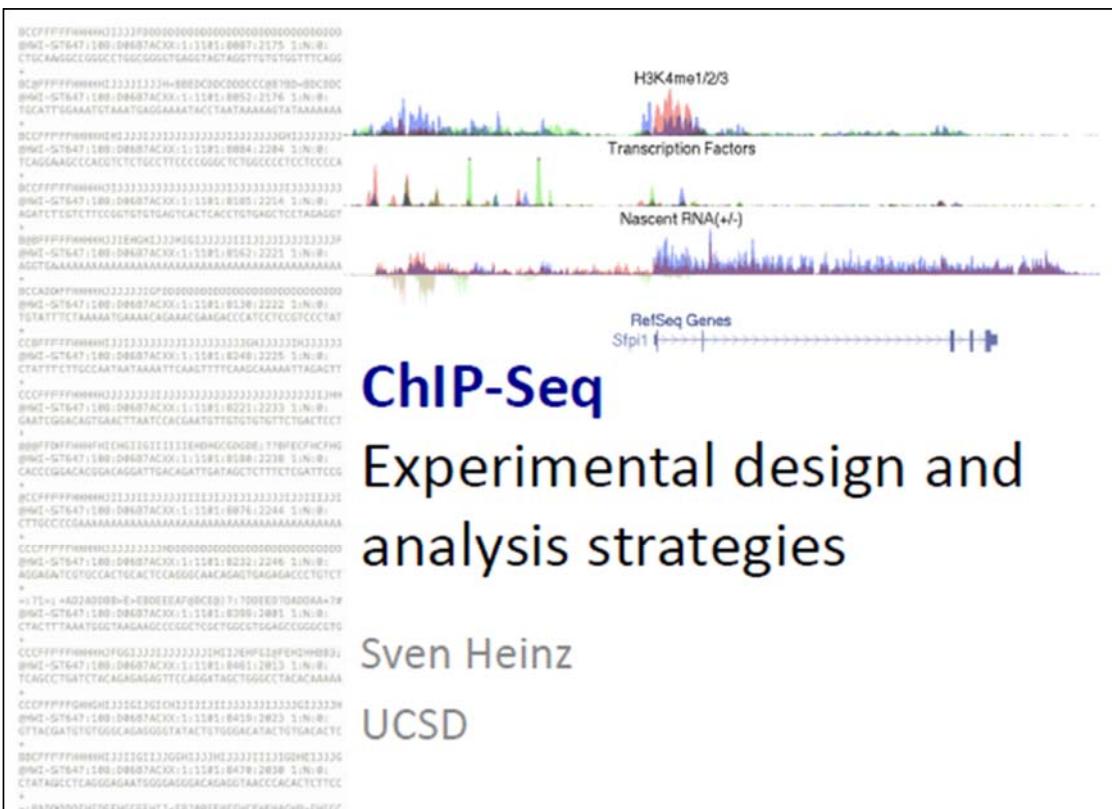

(b) Gene Repression

<http://www.mdpi.com/1999-4915/6/11/4165/htm>

ChIP-seq Experimental Design

http://pharmacology.ucsd.edu/graduate/courseinfo/BIOM231-SP13_8_ChIPseq.pdf

ChIP-Seq considerations

1. Sample requirement:

- Qubit assay: 10-100 ng (eg. 15 ng in 40 ul)
- Purity: OD 260/280 ratio at 1.7-1.9
- Smear pattern: BioAnalyzer HS DNA, distribution at 0.2-0.8kb, major~250bp
- Optional: qPCR confirmation of target genes

2. Controls:

- Negative: Mock (no primary Ab), Total INP, un-induced
- Positive: [primary Ab \(ChIP-grade\)](#) from independent sources

3. Sequencing format:

- SE or PE; read length 50-100nt
- barcode 12-48-plex

Sequencing and data QC

- **Sequencing Depth and Barcoding:**

- 10-20 million reads can reveal reasonable for a ChIP-Seq sample
- May require more reads to identify rare binding events
- SR: normal ChIP-Seq; with unique mapping provides quantitative detection
- PE or long read: to increase mapping precision, or for Allele-specific ChIP-seq

- **Data Quality Control:**

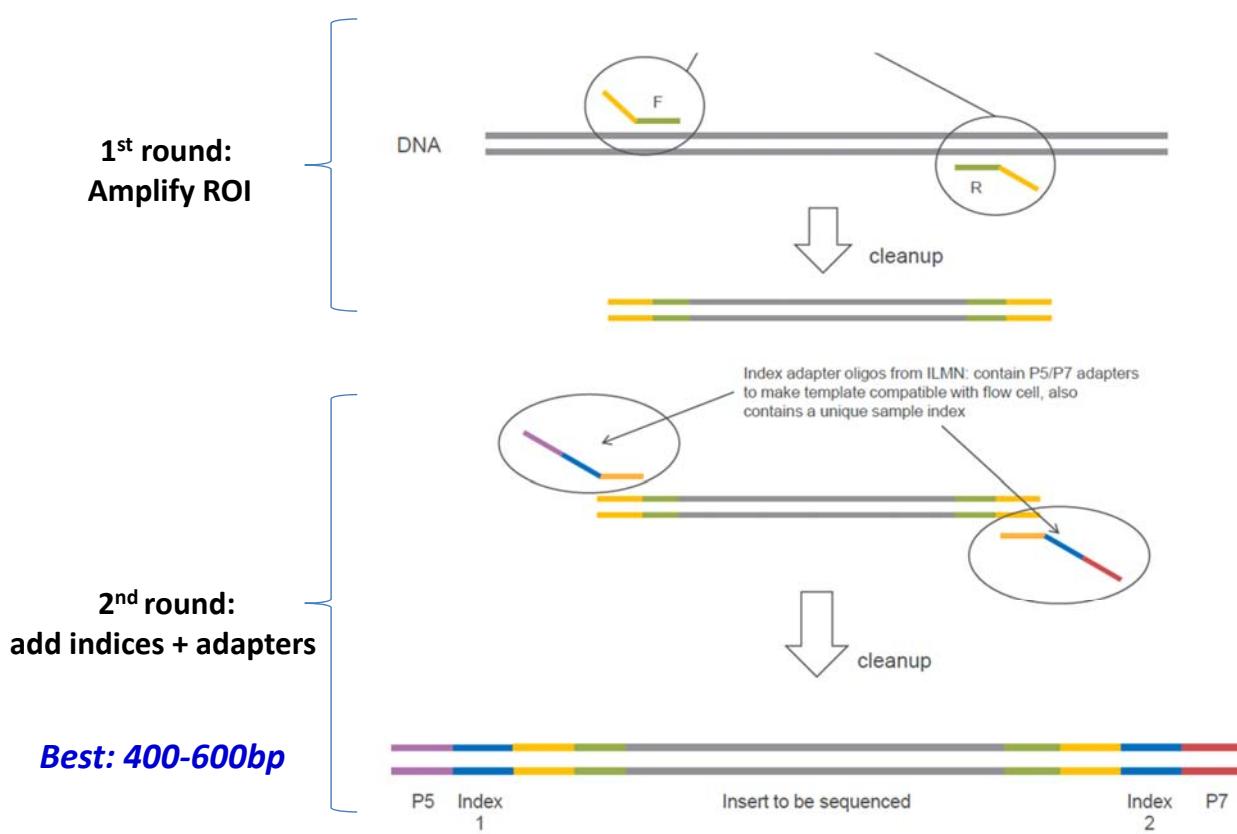

- low dups
- mapping to both strands
- similar GC% distribution of whole genome (low GC bias)
- data visualization in Genome Browser or IGV

Amplicon sequencing

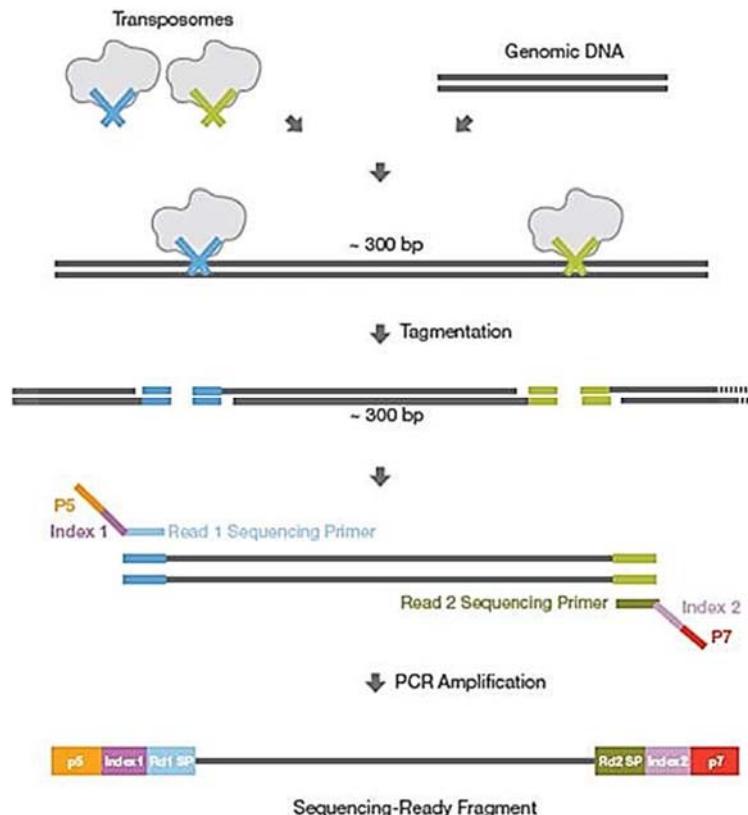

1. *Two-step PCR*
2. *NexTera XT tagmentation*

45

Amplicon library: 2-step PCR

NexTera Library prep - Tn tagging

http://www.gtbiotech.com.tw/products/NexTera_XT_DNA.asp

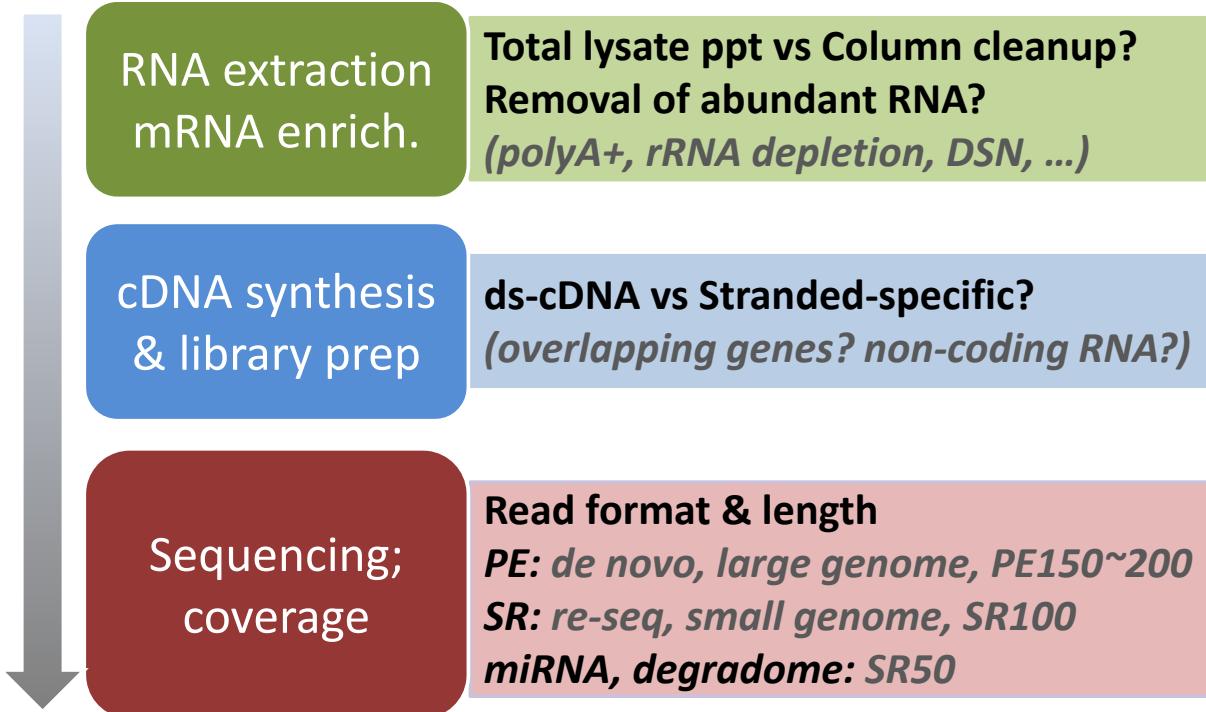

47

Transcriptome sequencing

- *mRNA vs stranded*
- *smRNA, non-coding RNA*

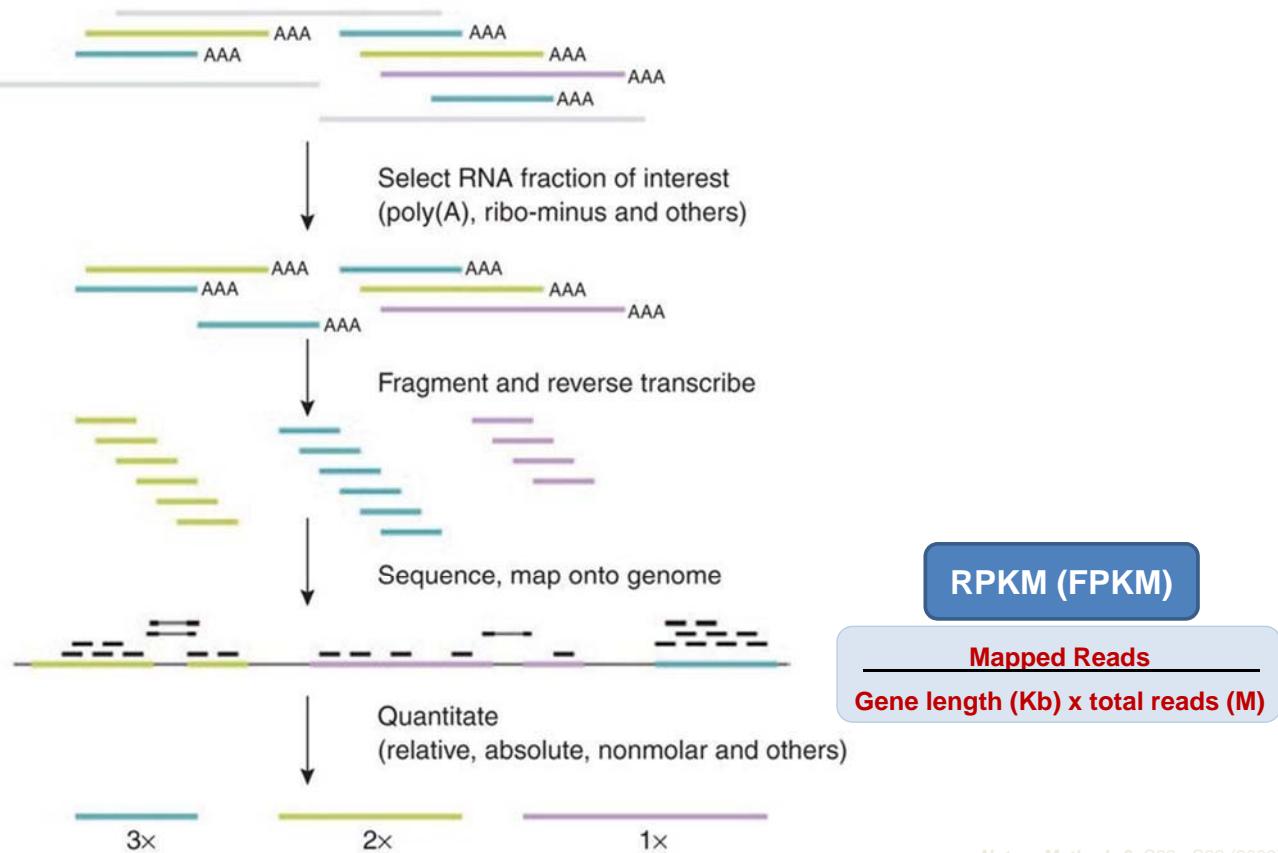

48

RNA-seq: considerations

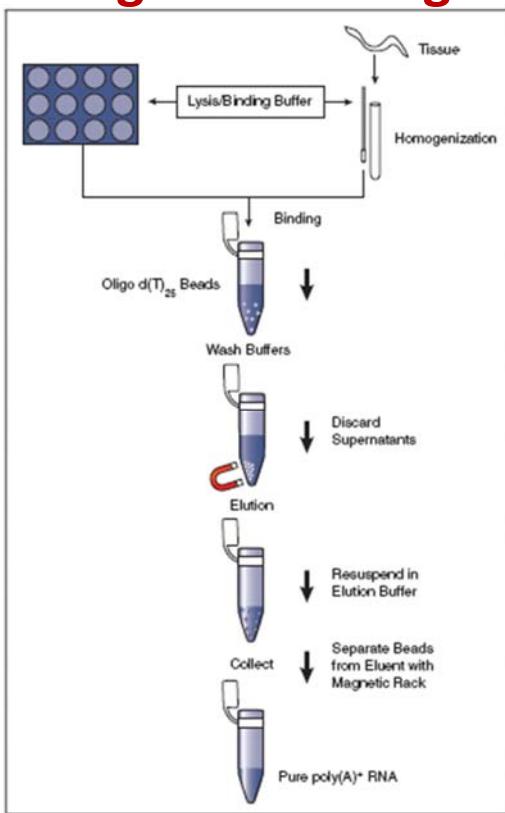

49

Transcriptome profiling: RNA-seq

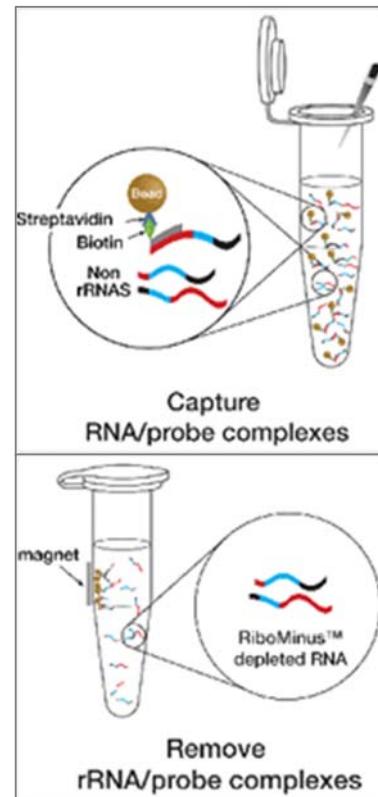

mRNA enrichment

Oligo-dT binding

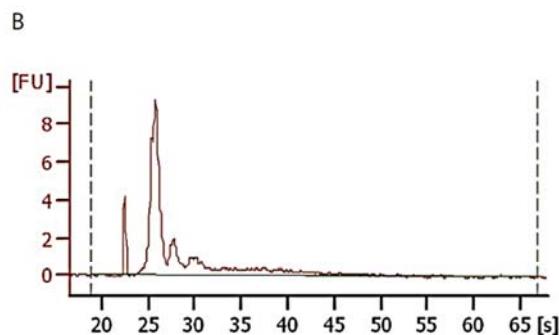

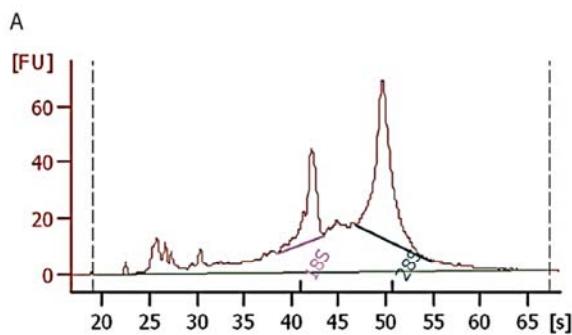

rRNA removal

51

rRNA Removal from Eukaryotic RNA

Figure 2. Removal of rRNAs from total RNA.

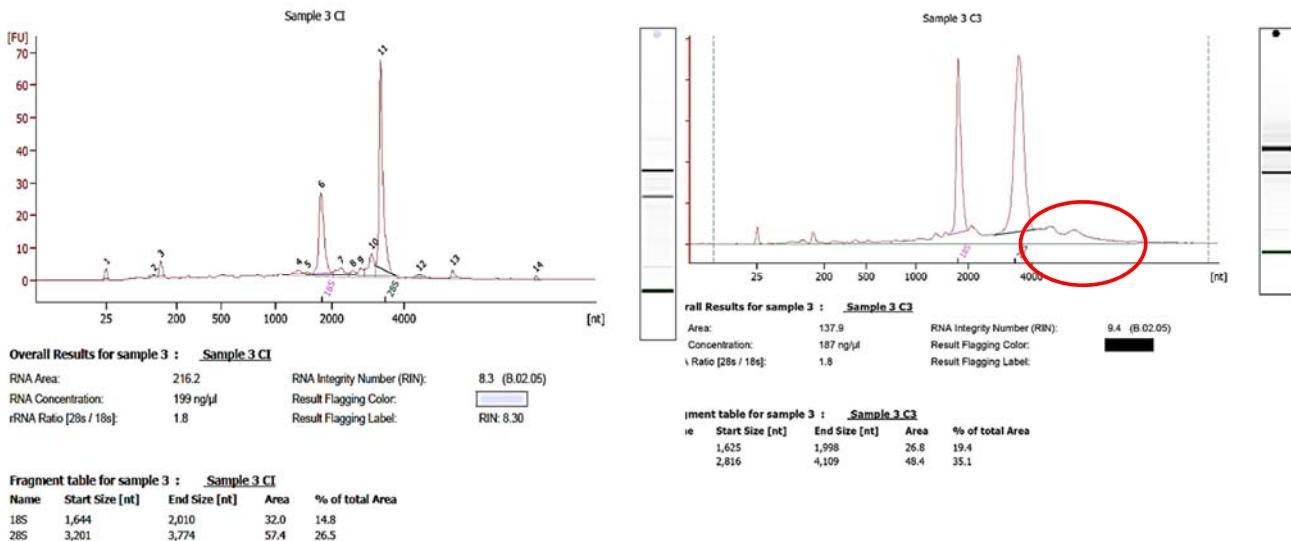

Removal of ribosomal RNAs from total RNA. Total RNA from MCF-7 cells was examined using a nanochip on a Bioanalyzer before (A) and after (B) treatment with the Ribo-Zero Gold Kit.

**rRNA depletion works for degraded RNAs,
but require deeper sequencing.**

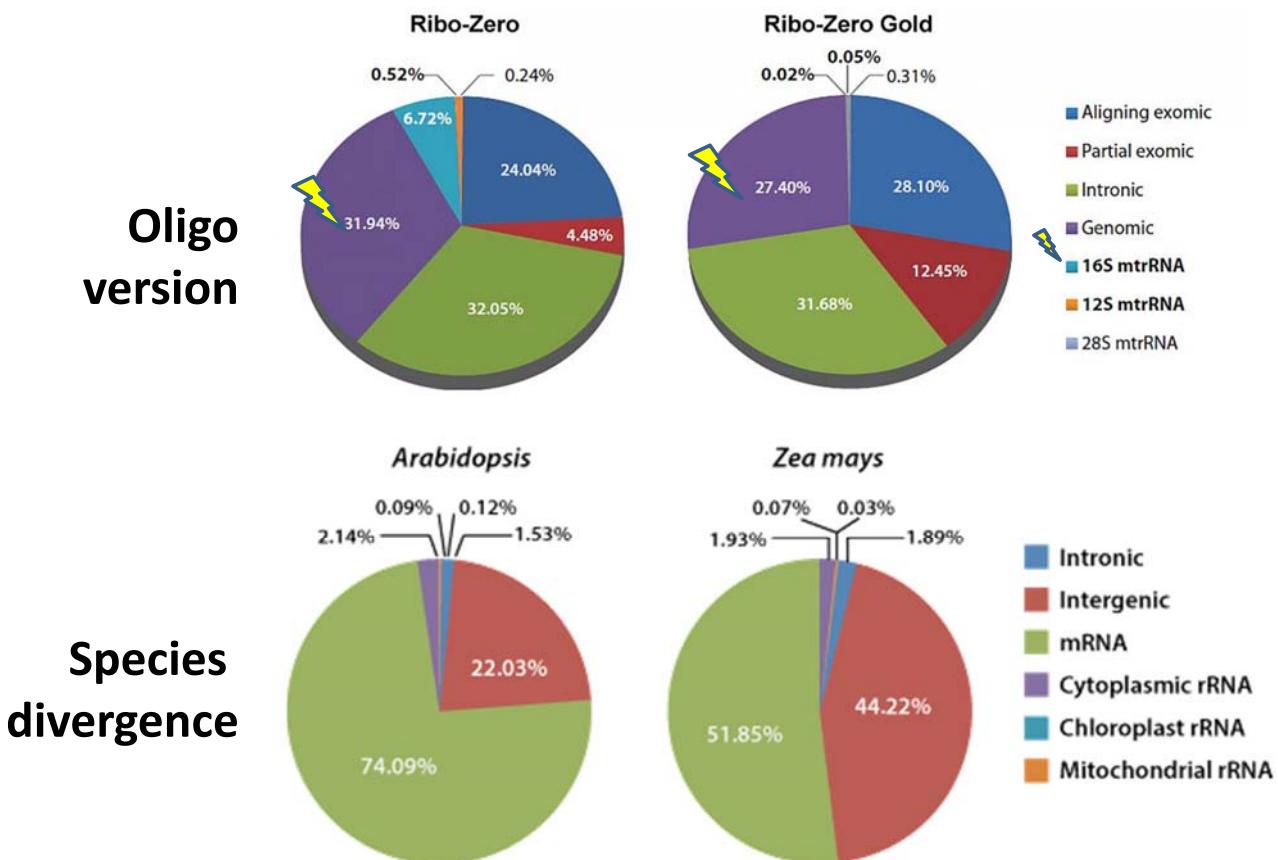

52

DNA contamination in RNA sample

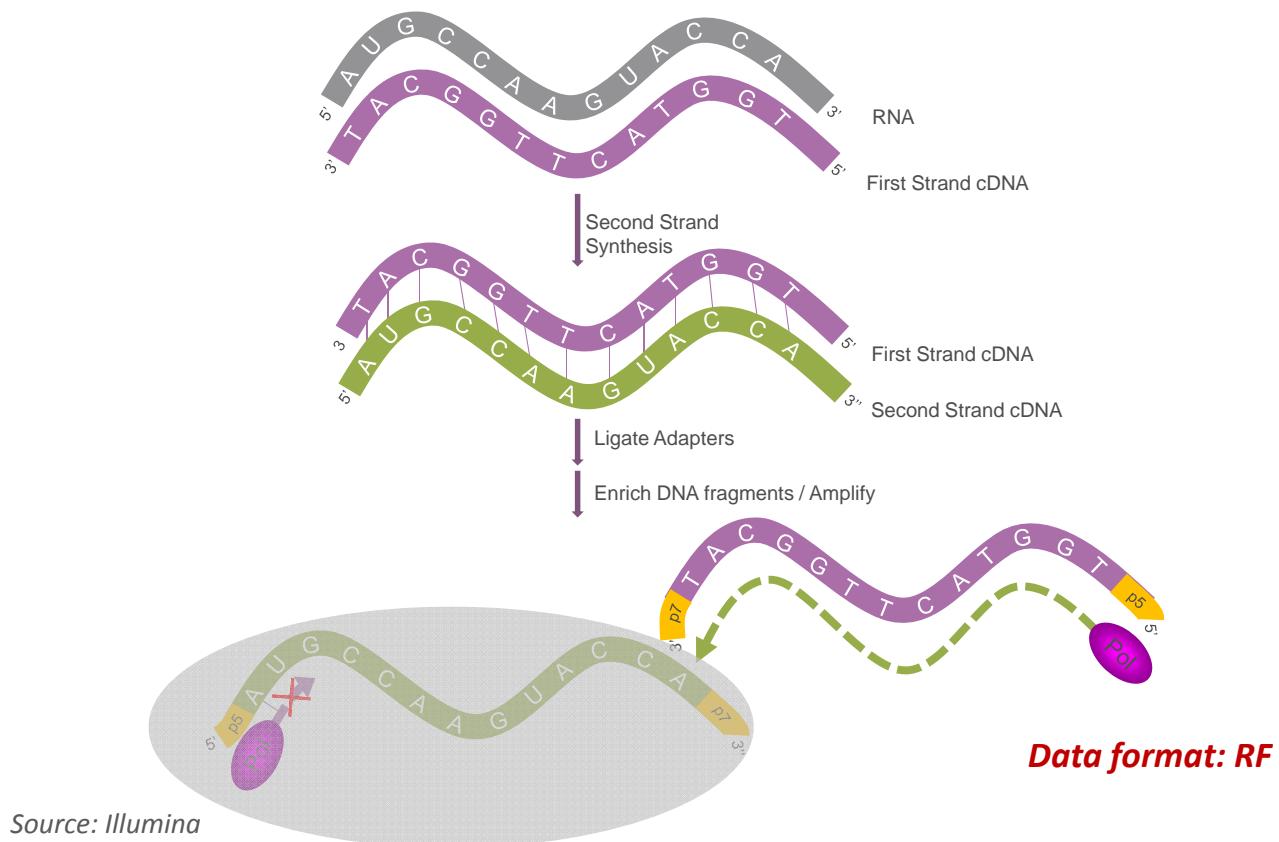

Have seen contamination up to 30%!!

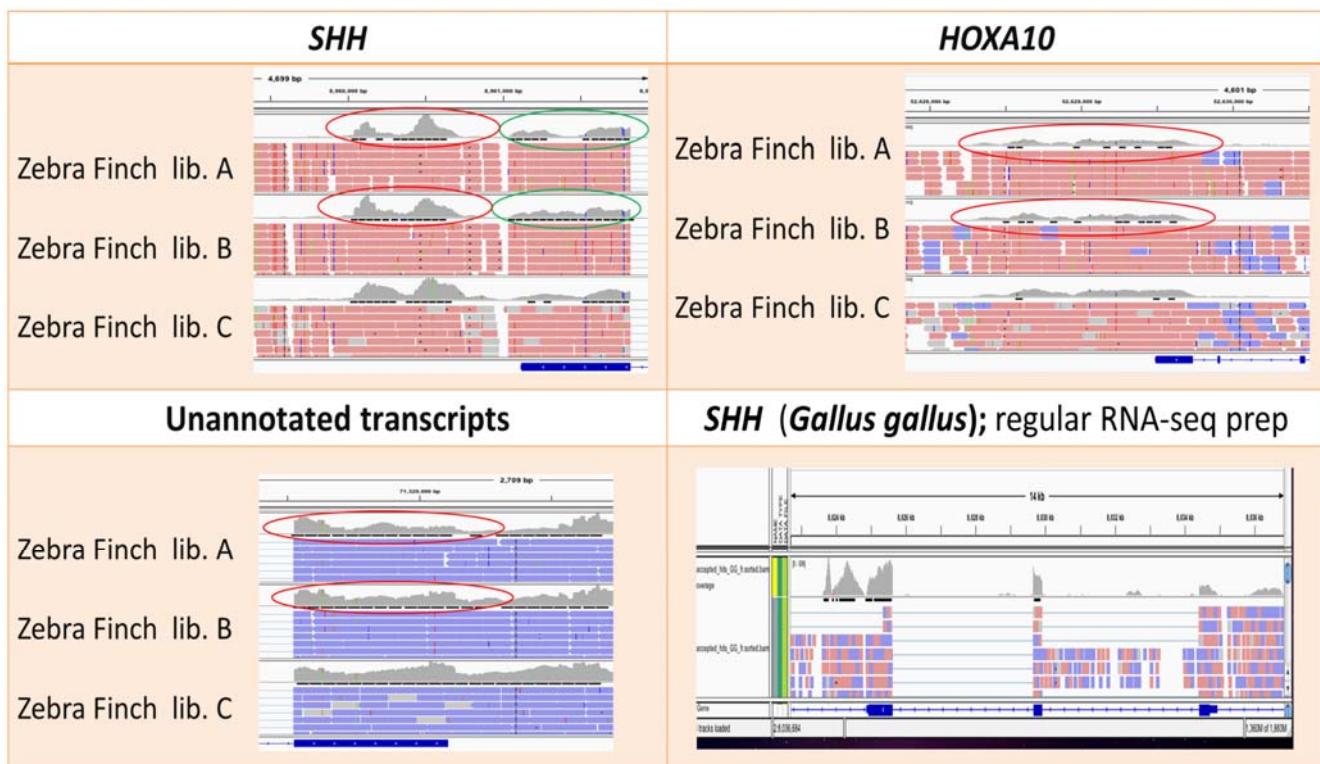

rRNA removal by RiboZero depletion

Strand-specific RNA-seq prep

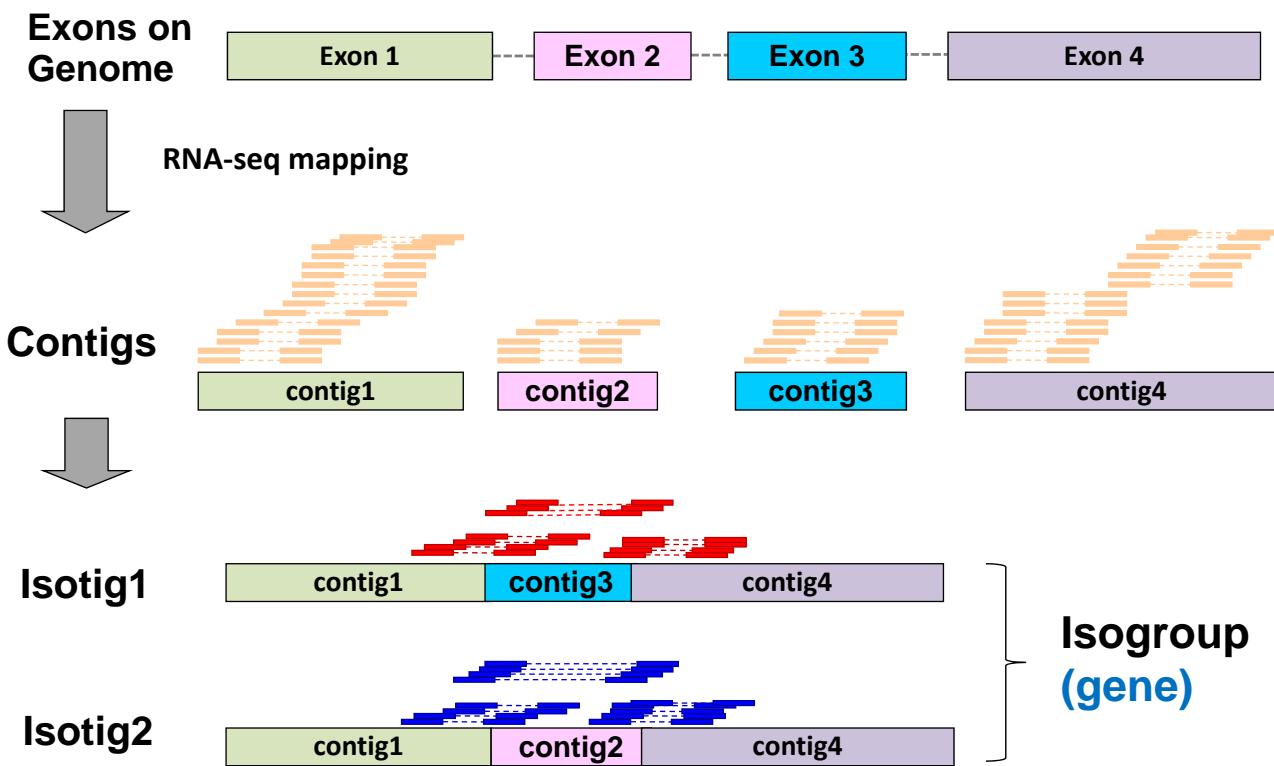

Stranded RNA-seq: >90% strand-specificity

*Genome viewer: IGV genome viewer (version 2.2), plus strand(Blue), minus strand(Red), no paired end info (could be plus or minus strand, Green).
non-stranded protocol the amount of blue alignments are almost equal to red alignment

59

PacBio: Iso-Seq

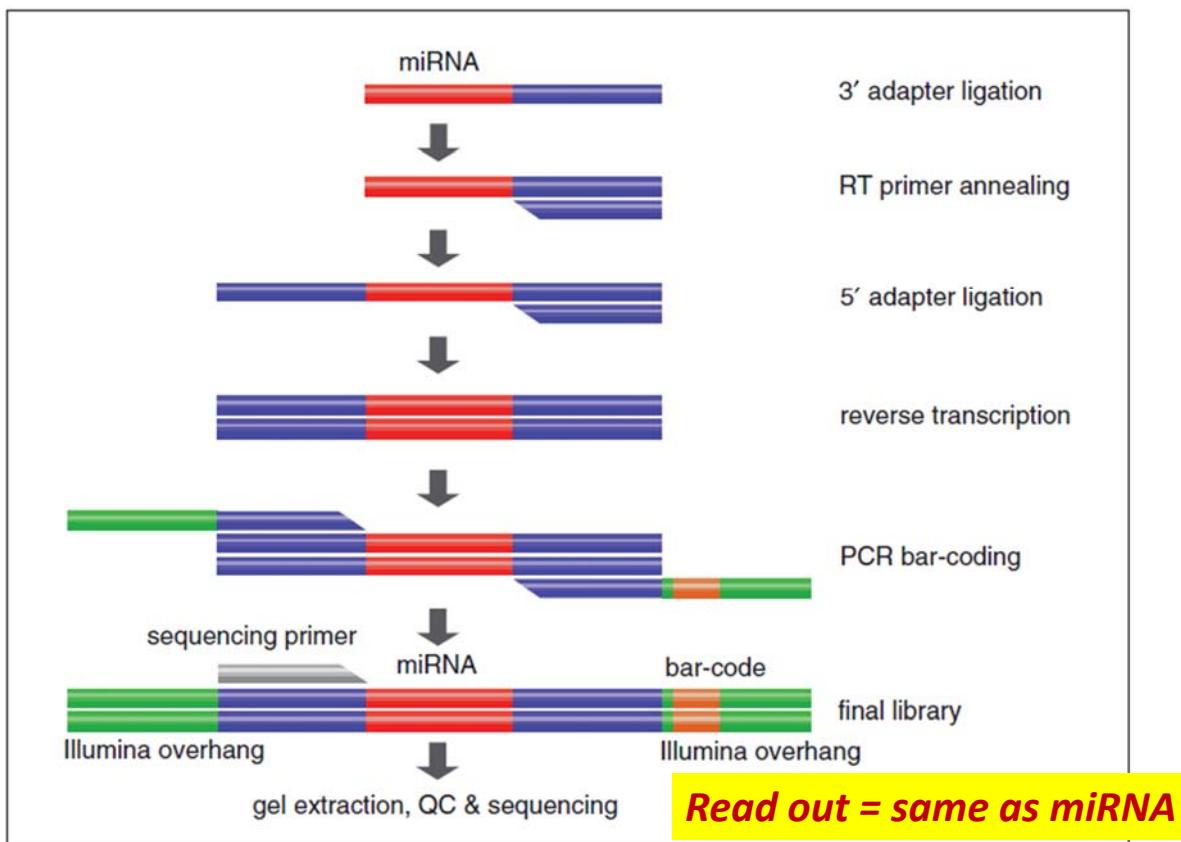

Transcriptome Sequencing

- **Sample:**
 - mRNA to pair with miRNA or lincRNA study?
- **mRNA enrichment method**
 - Oligo-dT vs Ribo-depletion
- **Controls and Biological replicates**
- **Time course?**
- **Re-sequencing (mapping) vs de novo assembly**
- **NGS:**
 - Shotgun: SR or PE
 - PE2*100~200bp
 - Coverage depends on need for detection sensitivity
- **Splicing variants? Fusion junction?**
 - Gel-size selection
 - PE2*150~300

61

smRNA library prep - Directional

Summary of NGS Project Design

- 1. Application type:**
 - NGS platform, sequencing format
 - data scale/coverage depth
 - Sequencing bias?
- 2. Sample nature:**
 - Ploidy, plastids, pure/meta sample
 - Genome size, GC%, repeats
- 3. Experimental Design:**
 - Biological replicate (n=3?)
 - Control set?
- 4. NGS bioinformatic algorithms**
 - For long or short reads? SR vs PE?
 - Computational demand

III. NGS Core & Prep works

- Sample requirement
- Considerations
- Submission to NGS Core

中央研究院生物多样性中心 新世代基因體定序核心實驗室 NGS Core Lab 諸福堂大樓 A603 負責人 [范秉峰](#) 電子 [\(02\)2787-1199](#) or 1198 ext. 9
Update: 2017/4/25

中央研究院 新世代基因體定序核心實驗室 NGS Sequencing Service Policy 定序服務條款

A. Sample Requirement

1. Please check on NGS Sample Preparation Guide ([download](#)) to ensure that your samples meet our requirement and be well-packaged. NGS core facility reserves the right to determine whether the unqualified sample can proceed to the library preparation.
2. Additional fees would be charged if there are any needs to re-prep library or do extra experiments requested by the user due to sample issues. The final service charge will be re-calculated depending on real experiment cost.

B. Sample Submission

1. As a part of our standard service procedure ([see Service Flow](#)), please email to Dr. Mei-Yeh Lu the NGS Application Form (Illumina or PacBio) and the Sample Submission Form prior to the actual submission for visual quality inspection. Please kindly include PI in all communicating emails, allowing PI to be updated timely on the project status and information.
2. All sample drop-offs should accompany appropriate forms signed by PI for project approval, and please contact Dr. Lu to make an appointment in advanced before you bring your samples to the NGS core facility. For contact information, please visit our website [Contact & Location](#).

C. Acknowledgement & Authorship

1. We appreciate your support if you mention NGS core facility in the acknowledgement section when the data using our sequencing services is published. You may add a sentence like this:

We thank the High Throughput Sequencing Core hosted in the Biodiversity Research Center at Academia Sinica for performing the NGS experiments.

2. If there are substantial contributions from NGS core facility in your research, including intellectual input, data analysis and interpretation, or special experiment design, it might be appropriate to involve core members in the list of authorship.
3. Please kindly share your publications on [here](#) in case we miss it. Thank you.

Supplemental Information of NGS Samples

Gel Image (required)

1. Post-run staining only.
2. Please indicate sample no. & major marker sizes (ladder should cover at least 0.1-10kb).
 - a. Gel percentage: ____ % of TAE or TBE agarose gel
 - b. Run condition: ____ voltage for ____ min
 - c. Loading amount: ____ ng of sample per lane; ____ ng of ladder per lane

中央研究院 新世代基因體定序核心實驗室
Supplemental Information of NGS Samples

BioAnalyzer Electropherogram (optional)

1. Please arrange images of BioA traces according to the sample number on the sample submission form.
2. BioA DNA High Sensitive 1000 7500 12000; or BioA RNA 6000 Nano Pico

Sample # 1	Sample # 2
Sample # 3	Sample # 4

高通量定序核心實驗室樣品送件流程

1. 填妥樣品送件單，E-mail至NGS Core負責人信箱，樣品確認沒問題即可送件
2. 參考NGS Core樣品送件須知，將樣品備妥
3. 預約定序樣品送件時間，即可進行送件
4. QC通過後將開始進行收費
5. 定序完成後寄送通知信件，即可上網下載定序資料

Sample Submission

1. Prior project communication; email files for preview
2. Submission by appointment:
 - a. Samples: Provide samples in low-bind tubes
 - b. transferred on ice/dry ice/liquid N2
 - c. Submit along with NGS application form & Sample form
 - d. Attach gel images and/or BioAnalyzer traces for quality check
 - e. Make appointment in advance

General Sample Requirements

DNA:

- RNase-treated and purified
- Submission amount > 3X of library input
- High purity (NanoDrop ratios, BioA, gel)
- Long integrity (>23~48kb)
- Low in inhibitors and contaminants (eg. EDTA, CTAB)
- Concentration: 200-800 ng/ul

RNA:

- DNase-treated and purified
- Submission amount >2X of library input
- High purity (NanoDrop ratios, BioA, gel)
- High in rRNA ratio, RIN
- Low in inhibitors and contaminants
- Concentration:
 - mRNA 200-1000 ng/ul
 - smRNA: 500-2000 ng/ul

Auxiliary equipments

**Qubit
Fluorometer**

**BioAnalyzer
(up to 11 samples)**

**Fragment Analyzer
(up to 96well plates*3)**

**Covaris
(DNA shearing)
0.2~10kb**

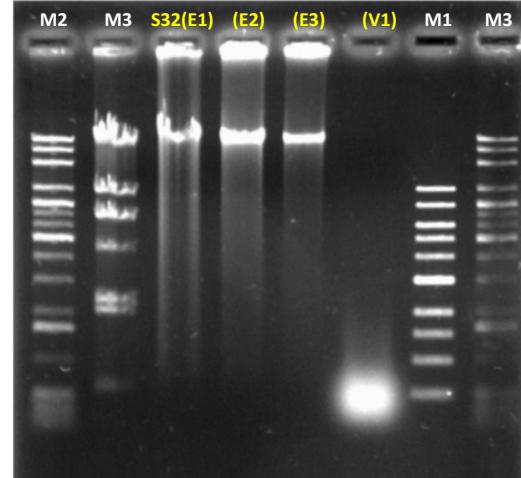

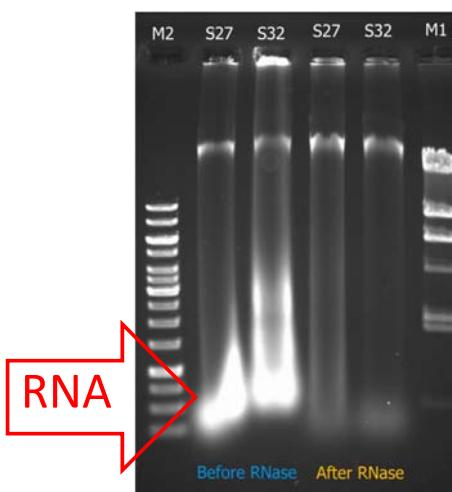

**BluePippin
(gel size selection)**

Trimmomatic: A flexible read trimming tool for Illumina NGS data

Citations

Bolger, A. M., Lohse, M., & Usadel, B. (2014). Trimmomatic: A flexible trimmer for Illumina Sequence Data. Bioinformatics, btu170.

Description

Trimmomatic performs a variety of useful trimming tasks for Illumina paired-end and single ended data. The selection of trimming steps and their associated parameters are supplied on the command line.

The current trimming steps are:

- ILLUMINACLIP: Cut adapter and other Illumina-specific sequences from the read.
- SLIDINGWINDOW: Perform a sliding window trimming, cutting once the average quality within the window falls below a threshold.
- LEADING: Cut bases off the start of a read, if below a threshold quality
- TRAILING: Cut bases off the end of a read, if below a threshold quality
- DROP: Cut the read to a specified length
- HEADCROP: Cut the specified number of bases from the start of the read
- MINLEN: Drop the read if it is below a specified length
- TOPHRED33: Convert quality scores to Phred-33
- TOPHRED64: Convert quality scores to Phred-64

It works with FASTQ (using phred + 33 or phred + 64 quality scores, depending on the Illumina pipeline used), either uncompressed or gzip'ed FASTQ. Use of gzip format is determined based on the .gz extension.

For single-ended data, one input and one output file are specified, plus the processing steps. For paired-end data, two input files are specified, and 4 output files, 2 for the 'paired' output where both reads survived the processing, and 2 for corresponding 'unpaired' output where a read survived, but the partner read did not.

Data pre-processing: eg. FastX-toolkit

FASTX-Toolkit
FASTQ/A short-reads pre-processing tools

Home | Download & Installation | Galaxy Usage | Command-line Usage | License | Useful Links | Contact

Introduction

The FASTX-Toolkit is a collection of command line tools for Short-Reads FASTA/FASTQ files preprocessing.

Next-Generation sequencing machines usually produce FASTA or FASTQ files, containing multiple short-reads sequences (possibly with quality information).

The main processing of such FASTA/FASTQ files is mapping (aka aligning) the sequences to reference genomes or other databases using specialized programs. Examples of such mapping programs are: [Blast](#), [SHRIMP](#), [LastZ](#), [MAQ](#) and many many others.

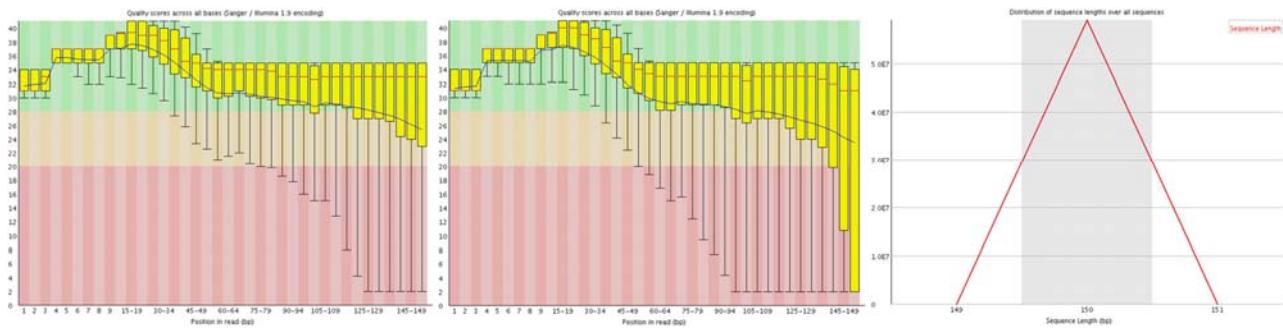

However, it is sometimes more productive to preprocess the FASTA/FASTQ files before mapping the sequences to the genome - manipulating the sequences to produce better mapping results.

The FASTX-Toolkit tools perform some of these preprocessing tasks.

Public Resources

NGS data analysis

Data intensive biology for everyone.

Galaxy is an open, web-based platform for data intensive biomedical research. Whether on the [free public server](#) or [your own instance](#), you can perform, reproduce, and share complete analyses.

The screenshot shows the Galaxy web interface. On the left, there's a sidebar with a search bar and a list of tools categorized under 'Tools'. The main content area features a 'Try Galaxy on the Cloud' section with a purple background and white text. Below it is a 'Tweets' section showing a tweet from @galaxyproject. To the right, there's a 'History' panel with a message about purged data. Logos for Penn State, Johns Hopkins University, Oregon Health & Science University, TACC, and CyVerse are displayed. A note at the bottom states that the Galaxy Team is part of the Center for Comparative Genomics and Bioinformatics at Penn State, the Department of Biology at Johns Hopkins University, and the Computational Biology Program at Oregon Health & Science University. The URL <https://usegalaxy.org/> is shown at the bottom right.

OMICS Tools: High Throughput Sequencing

The screenshot shows the OMIC TOOLS website. At the top, there's a search bar and links for 'SIGN UP / SIGN IN' and 'ABOUT'. Below the header, a teal bar labeled 'HIGH-THROUGHPUT SEQUENCING' contains a grid of 15 tool categories, each with an icon and a brief description. To the right, there's a circular diagram titled 'OMICS COLORS' with icons representing various biological fields: Metabolomics, Genomics, Epigenomics, Transcriptomics, Proteomics, and Phenomics. The URL <http://omictools.com/sga-s1518.html> is shown at the bottom.

European Nucleotide Archive - Reads

1. NCBI SRA is a repository for NGS sequenced reads

2. Data is stored in association with basic metadata explaining experimental techniques and inter-sample relationships

3. Data format is NCBI-specific SRA/and SRA-lite format. “Universal” lossless format.

4. Upload and download is offered via FTP and HTTP.

1000 Genomes
A Deep Catalog of Human Genetic Variation

95

International consortium announces the 1000 Genomes Project.

Any two people have 99% identical DNA.

Genome sequences are important

1001 Genomes

A Catalog of *Arabidopsis thaliana* Genetic Variation

Home Collaborators Accessions Tools Downloads Data Center Gallery About

Welcome to the 1001 Genomes Project

The 1001 Genomes Vision

The 1001 Genomes Project, launched at the beginning of 2008, has a simple goal: to discover the whole-genome sequence variation in 1001 strains (accessions) of the reference plant *Arabidopsis thaliana*. The resulting information will pave the way for a new era of genetics that combines large-scale association studies in wild strains with forward genetic analyses in experimental crosses, in order to identify alleles underpinning phenotypic diversity across the entire genome and the entire species. The analyses enabled by this project will have broad implications for areas as diverse as evolutionary sciences, plant breeding and human genetics.

This 1001 Genomes Project is particularly timely because the current technological revolution in sequencing means that it is now feasible to resequence large numbers of genomes. Indeed, a 1000 Genomes project for humans has just been launched in early 2008 as well. There are, however, several important differences between the two projects. The most important one is that each of the accessions in the *Arabidopsis* 1001 Genomes project is an inbred line with seeds that will be freely available from the stock centre to all our colleagues. Unlimited numbers of plants with identical genotype can be grown and phenotyped for each accession, in as many environments as desired, and so the sequence information we collect can be used directly in association studies at biochemical, metabolic, physiological, morphological, and whole plant-fitness levels.

As of early 2010, the complete genome sequences of over 80 accessions have already been released by the Max Planck Institute. There are commitments for the remaining accessions, primarily from the Salk Institute, the Gregor Mendel Institute and Monsanto, and we are hoping for completion of the 1001 Genomes project in the first half of 2011.

Progress as of June 2, 2010:

C o m m i t m e n t s :	1	0	0	1
S e q u e n c i n g u n d e r w a y :	9	9		
F i n i s h e d g e n o m e s :	1	5	7	
R e l e a s e d g e n o m e s :	9	1

News

Mai 3, 2010

A collection of 80 *A. thaliana* accessions sequenced as part of the 1001 Genomes Project is available from ABRC. Each of the accessions is an inbred line that can be ordered as an individual line or as a set (CS76427). These stocks can be found using the [ABRC catalog](#).

February 2, 2010

The Weigel laboratory has just released 80 *Arabidopsis thaliana* genomes sequenced with paired end Illumina short reads. SNPs and structure variants (SVs) are now available online. For more details, please read the [README file](#).

ENCODE Overview

The National Human Genome Research Institute (NHGRI) launched a public research consortium named ENCODE, the **Encyclopedia Of DNA Elements**, in September 2003, to
